Appendix J	Detailed Draft Safety Plan

**(Technical Appendix Available Upon Request)**

## EXECUTIVE SUMMARY

Tetra Tech has reviewed the potential traffic impacts associated with the proposed peak construction activity of the Horse Heaven Wind Farm, LLC project (the Project) to be located in the Horse Heaven Hills area on unincorporated land in Benton County, Washington. Horse Heaven Wind Farm, LLC (Applicant) is proposing to construct and operate a renewable energy generation facility that would have a maximum grid injection capacity of up to 1,150 megawatts for a combination of wind and solar facilities, battery energy storage systems (BESS), and other Project components, including underground and overhead electrical collection lines, underground communication lines, new Project substations, access roads, operations and maintenance facilities, and meteorological towers.

At its closest point, the Project would be located approximately four miles south/southwest of the City of Kennewick and the larger Tri-Cities urban area, along the Columbia River. The Project's Lease Boundary (approximately 72,428 acres) incorporates all of the parcels for which the Applicant has executed a lease to construct the wind turbines, solar arrays, and associated facilities. The Project's Wind Energy Micrositing Corridor encompasses 11,850 acres within the Lease Boundary and consists of the areas where the turbines and supporting facilities would be sited during the final design. The Applicant seeks authorization for an original scope of up to 244 turbine locations and a maximum of three solar arrays, with all possible turbine locations and solar arrays cumulatively reviewed to analyze potential resource impacts.

There are two options for the wind turbines currently under consideration (Option 1 and Option 2). The final number and location of turbines within the proposed Wind Energy Micrositing Corridor would reflect the final engineering design, model selection, and any additional avoidance and mitigation identified in the Final Environmental Impact Statement (FEIS). The specific model used would depend on the commercial availability and technology at the time of construction. The number of turbines would not exceed 244, and the maximum turbine height (at blade tip) would not exceed 671 feet. The Draft Environmental Impact Statement (DEIS) previously prepared for the Project assumed that the road disturbance associated with Turbine Option 1 and Turbine Option 2 would be identical.

As currently proposed, the Project would be built in two construction phases (Phase 1 and Phase 2). Phase 1 construction could generate power via wind and solar. Phase 1 could also include a BESS capable of storing energy. Phase 2 construction has two alternatives (Phase 2a and Phase 2b). Phase 2a could consist of the construction of both wind and solar facilities. The Applicant's Phase 2a scenario also includes the construction of a BESS. Phase 2b could increase power generation via the construction of additional wind turbines, but construction would not include a BESS or solar array.

During peak construction of each phase, a typical day would include the transportation of workers, materials, and movement of heavy equipment. Numerous on-site roadways are proposed to support the Project as well as two laydown areas. The laydown areas would facilitate the delivery and assembly of materials and equipment. They would also serve as parking areas for the construction workforce. An additional tower transfer yard will be used to support the delivery of tower components prior to construction.

Preliminary transportation assessments were previously included in the December 2022 DEIS and February 2021 (as revised December 2022) updated Application for Site Certification (ASC) for the Project. Pending approval of the Site Certification Agreement (SCA), the Applicant now anticipates beginning construction of the first phase of the Project in late 2024 or early 2025 with commercial operation approximately 11 months following start of construction. A second phase of the Project would begin

construction in 2025 and begin operation in 2026. The construction schedule would be revised according to the actual approval of the Site Certification Agreement and implementation of commercial agreements for power purchase, and a copy provided to EFSEC at least 60 days prior to the start of construction or as required under the SCA.

Based on comments received on the DEIS, EFSEC has requested that a more detailed Traffic Impact Analysis be provided the Project.

A summary of the study methodology and key findings is presented below.

## Study Methodology

The study methodology for the detailed Traffic Impact Analysis was developed in consultation with representatives from the Washington Department of Transportation (WSDOT) South Central Region at a traffic scoping meeting for the Project that was held virtually on June 7, 2023. The purpose of the meeting was to discuss the initial assumptions documented in the Project Traffic Scoping Letter (TSL) dated May 24, 2023, which identified key aspects of the traffic study methodology including the study area roadways and intersections to be reviewed, consideration of other possible area developments and background traffic growth, and anticipated vehicle trip generation and trip distribution characteristics of the Project and the analysis required to evaluate the potential Project-related traffic impacts.

The study evaluates existing and future traffic operations (with and without the proposed Project) at 29 existing intersections, and the proposed site driveways serving two laydown areas and 10 roadway segments for key roadways serving the Project site. The study provides a detailed analysis of roadway and intersection capacity during the weekday morning and weekday evening peak hours, when the combination of existing traffic on the surrounding area roadways and new traffic associated with peak construction activity of the Project would be greatest.

The 2023 Existing traffic volumes were developed based on intersection Turning Movement Counts (TMCs) collected at the 29 existing study area intersections on Tuesday June 13<sup>th</sup> and Wednesday June 14<sup>th</sup> 2023. Construction hours of operation are anticipated to generally occur from 7:00 AM to 7:00 PM. For the purposes of the study, the TMCs were collected at the study area intersections from 5:00 AM to 8:00 AM and 4:00 PM to 8:00 PM to establish the weekday morning and evening commuter peak hour conditions. In addition, Automatic Traffic Recorder (ATR) counts collected over a 24-hour weekday period in June 2023 for eight study area roadways. The ATR data collected as part of this study was then supplemented with daily and peak period traffic count data for two additional study area roadways obtained from the WSDOT permanent traffic count stations located on Route 221 and I-82 in the vicinity of the Project site.

As part of the assessment of existing traffic conditions, Tetra Tech conducted extensive field observations, which included photos of the study area intersections, and dash cam video footage along all of the principal roadways in the vicinity of the Project site. Field observations were used to document existing roadway and intersection lane geometry, posted speed limits and traffic control. Tetra Tech obtained crash data from WSDOT for the most recent five-year period available to identify possible existing traffic safety deficiencies at the study area intersections.

Tetra Tech contacted WSDOT and Benton County planning staff to identify what, if any, planned roadway improvements (implemented by others) would be constructed either before or during the construction of the Horse Heaven Wind Farm Project. Based on these discussions, there are currently no planned projects

that would result in changes in future traffic operations at the study area roadways and intersections within the anticipated time frame of the construction of the proposed Project.

As currently proposed, the Project would be constructed in two phases, which would occur in successive 11-month periods, with Phase 1 beginning in late 2024/early 2025. As a conservative measure, the future design year chosen for analysis in the TIA was the year 2025 for Phase 1 and the year 2026 for Phase 2.

The 2023 Existing peak hour traffic volumes were projected to the future design years of 2025 and 2026, by which time the Project's peak construction activity is expected to occur. The 2023 Existing traffic volumes were grown by 1.0 percent per year for the two design year forecast periods (2025 and 2026) and the traffic volumes adjusted to reflect the 2025 No Build (Without Project) and 2026 (Without Project) conditions.

It is expected that Phase 1 will begin construction on the eastern side of Interstate 82 (I-82). As Phase 1 construction continues, it is expected that peak construction activity will move westward across the Project lease area. To be conservative with our analysis, peak construction activity for Phase 1 was analyzed travelling to Laydown Yard 1 and Laydown Yard 2. It is expected that Phase 2 will only occur on the western side of the Project lease area. Peak construction activity for Phase 2 was only analyzed heading to Laydown Yard 2.

The traffic increases associated with the Project's peak construction activity during Phase 1 were then added to the 2025 No Build (Without Project) weekday peak hour traffic volumes to reflect the 2025 Phase 1 Build peak hour traffic volumes, and the traffic increases associated with Phase 2 were added to the 2026 No Build (Without Project) peak hour traffic volumes to reflect the 2026 Build (With Phase 2 Peak Construction) conditions.

Roadway and intersection capacity analyses were then conducted at each of the study intersections for the following scenarios to identify potential existing and projected traffic deficiencies near the Project site:

- 2023 Existing AM/PM Peak Hours
- 2025 No Build (Without Project) AM/PM Peak Hours
- 2026 No Build (Without Project) AM/PM Peak Hours
- 2025 Phase 1 Build to Laydown Yard #1 AM/PM Peak Hours
- 2025 Phase 1 Build to Laydown Yard #2 AM/PM Peak Hours
- 2026 Phase 2 Build to Laydown Yard #2 AM/PM Peak Hours

## Future Site-Generated Traffic

The Project will consist of three stages: construction, O&M, and decommissioning. The highest volume of site-related trips will occur during the peak construction phase of the Project. Consequently, the traffic impact analysis in this report is based on the vehicle trip generation associated with the peak construction phase workforce levels. Preliminary vehicle trip generation estimates were included in the Project's ASC. These estimates were further refined as part of the previously prepared TSL to inform the study area and be used as the basis for analysis in the TIA.

Construction of the proposed energy facility is expected to include site grading, construction of temporary access roads, wind turbine and solar panel installation, inspections, and equipment deliveries. It is anticipated that, at peak operations, the site could experience construction workforce levels of up to 467 construction workers at one time. There are no public transportation services in the vicinity of the Project site that are anticipated to be used for the Project. Therefore, for the purposes of this assessment, it was assumed that no construction workers would use public transit to access the site. However, it is anticipated that some construction workers would arrive and depart the site together (carpooling). For purposes of this assessment, it was assumed that the average vehicle would have 1.25 occupants to represent carpooling to/from the site.

Construction hours of operation are assumed to generally be 7:00 AM to 7:00 PM with the majority of construction workers arriving prior to 7:00 AM and departing after 7:00 PM. Since the peak hours of the adjacent street traffic are expected to occur sometime during the peak commuting periods of 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM, it is expected that the majority of construction workers would arrive and depart the site outside of the typical weekday morning and weekday evening commuter peak hours of the adjacent streets. However, to present a conservative assessment of potential traffic increases associated with the Project, it is assumed that all of the construction workers would arrive during the weekday morning peak hour and depart during the weekday evening peak hour. The proposed Project is expected to generate approximately 1,498 weekday daily workforce trips and 374 weekday peak hour workforce trips during Phase 1 peak construction activity.

The peak construction activities are currently anticipated to occur for only a portion of each the two successive 11-month periods. The remainder of the construction period is anticipated to generate fewer vehicle trips. The supporting trip generation calculations and assumptions for the proposed Project's peak construction workforce levels are provided in Section 3.2.1

There are currently two alternatives being considered for Phase 2 of the Project construction. Table 7 presents a summary of the trip generation estimates for the proposed Project's peak construction workforce activities by phase. The more conservative trip generation of the two Phase 2 alternatives (Phase 2a) will be used for the TIA analyses. Phase 2a peak construction activity is expected to generate approximately 1,376 weekday daily workforce trips and 344 weekday peak hour workforce trips.

## Project Trip Distribution Patterns

Tetra Tech developed separate Project trip distribution patterns for the Project's peak construction activities at the two proposed laydown areas. The trip distribution patterns were developed based on consideration of the effective population within the anticipated employment workforce (approximate two-hour drivetime zone) and the currently proposed location of the laydown area for each phase.

## Intersection Capacity Analysis

To quantify potential traffic impacts associated with the proposed development, Tetra Tech conducted intersection capacity analyses at key intersections near the Project site for the following scenarios.

- 2023 Existing AM/PM Peak Hours
- 2025 No Build (Without Project) AM/PM Peak Hours
- 2026 No Build (Without Project) AM/PM Peak Hours
- 2025 Phase 1 Build to Laydown Yard #1 AM/PM Peak Hours
- 2025 Phase 1 Build to Laydown Yard #2 AM/PM Peak Hours
- 2026 Phase 2 Build to Laydown Yard #2 AM/PM Peak Hours

The capacity analyses indicate that all study area intersections and roadways operate well below capacity at level-of-service (LOS) C or better operations during the weekday peak hours. Therefore, there is ample capacity at the study area intersections and roadways to support the peak construction operations associated with the Project.

## Traffic Safety Analysis

Tetra Tech conducted a traffic safety analysis for each of the study area intersections based on procedures outlined in the Safety Analysis Guide published by the Washington State Department of Transportation (WSDOT) using the Highway Safety Manual (HSM) spreadsheet tool, version 9.1 (<http://safetyperformance.org/tools/>). Tetra Tech obtained Crash Data from WSDOT for the study area roadways and intersections for the most recent five-year period available. Highway Safety Manual (HSM) predictive methods were used to analyze safety at each of the study area intersections in accordance with WSDOT guidelines using Transportation Research Board (TRB) Federal Highway Administration (FHWA) IHSDM software.

The HSM analysis indicates that four of the study area intersections, listed below, could potentially be improved with safety improvements:

- Route 221 at Sellards Road
- Route 221 at Route 14
- Route 14 at S. Plymouth Road
- Webber Canyon Road and Badger Road

The HSM spreadsheet tool was used to calculate the Predicted Crash Frequency and the Expected Crash Frequency for each intersection to determine which intersections had potential for traffic safety improvement. Tetra Tech analyzed the effectiveness of potential safety mitigation measures to address existing safety deficiencies, including the provisions of additional lane geometry (separate left-turn or right-turn lanes on the main road approaching the intersection) and providing street lighting where it is not currently provided.

The HSM spreadsheet tool indicates that the provision of separate left-turn and right-turn lanes and street lighting (where not currently provided) could potentially reduce the crash frequency at these intersections. An auxiliary lane warrant analysis to determine whether or not installation of a turn lane at these four locations would be warranted. Two of the study intersections (Route 14 at S. Plymouth Road and Route 221 at Route 14) meet the traffic volume threshold for implementation of additional turn lanes under existing traffic volume conditions (independent of the Project construction activity). The left-turn lane warrant was not met for any of the analysis scenarios.

In addition, the available Stopping Sight Distance (SSD) for vehicles approaching the high crash frequency intersections is well in excess of the required SSD for the posted speed limit. This indicates that drivers approaching the intersection will have more than sufficient view of potential turning traffic at the intersection to either stop or adjust their speed to avoid a collision.

The proposed Project is not anticipated to materially impact future traffic operations or safety at any of the study area intersections. However, as part of the proposed Project, the Applicant will develop a comprehensive Construction Traffic Management Plan (CTMP) for each phase of the construction to alert drivers of potential increased construction traffic and turning activities at key intersections throughout the study area. The Applicant will also work with the general contractor (once selected) to identify truck haul routes to and from the construction laydown areas to avoid sensitive areas and minimize impacts to local agricultural activity along the study area roadways, to the extent possible. In addition, the Applicant will prepare a Traffic Safety Plan (TSP) for the Project-related construction traffic activity in accordance with WSDOT standards. A detailed description of the draft TSP is provided in the subsequent sections of this report.

### Travel Demand Management Measures

There are currently no public transportation services in the vicinity of the proposed laydown areas. However, the Applicant commits to implementing a Transportation Demand Management (TDM) program to reduce automobile travel and traffic impacts associated with the Project construction. Potential TDM measures include the following:

- Encourage carpooling among the construction workforce
- Provide a transportation coordinator who can match workers for carpooling
- Explore the feasibility of providing shuttle bus service between the proposed laydown areas and the construction sites
- Explore the feasibility of coordinating a Vanpool service from select locations within the Tri-Cities area.

### Conclusions

The proposed Project is anticipated to generate negligible traffic once constructed. During the peak construction phases of the Project, a workforce of up to 467 construction workers is anticipated. Tetra Tech has evaluated the potential traffic impacts associated with this temporary increase in traffic at 29 existing study area intersections and the proposed site driveways at the two laydown areas. **The analysis indicates that ample capacity is available within the study area to support the peak construction workforce levels associated with the Project with all intersections operating well below capacity at LOS C or better operations.**

The safety analysis conducted as part of this study indicates that four of the existing study intersections would benefit from potential safety mitigation measures to address existing safety deficiencies. An auxiliary lane warrant analysis indicates that two of the study intersections (Route 14 at S. Plymouth Road and Route 221 at Route 14) currently meet the traffic volume threshold for implementation of separate right-turn lanes under existing traffic volume conditions (independent of the Project construction activity). However, **the intersection capacity analysis indicates that these intersections will continue to operate well below capacity during all phases of Project construction.** In addition, **the available sight distances at the high crash rate intersections are well above the required SSD, indicating that motorists approaching these locations will have more than sufficient view of the potential turning movements at the intersections to stop or adjust their speeds as needed to avoid a potential collision.**

Given the temporary nature of the potential traffic increases associated with Project construction, **no additional turn lanes are recommended at these intersections by the Applicant as part of the proposed Project at this time.** However, the Applicant will develop a comprehensive CTMP, for each

phase of the construction, to alert drivers of potential increased construction traffic and turning activities at key intersections throughout the study area. The Applicant will also work with the general Balance of Plant, or construction contractor (once selected) to identify truck haul routes to and from the construction laydown areas to avoid sensitive areas and minimize impacts to local agricultural activity along the study area roadways, to the extent possible. In addition, the Applicant will prepare a TSP for the Project-related construction activity in accordance with WSDOT standards. The Applicant will also work with the contractor to develop a TDM program to minimize reliance on single-occupant vehicles and reduce single-occupancy vehicle trips to and from the site.

Based on the analyses presented in this report and upon implementation of the recommended CTMP and TSP, **the potential traffic increases associated with the proposed Project can be safely accommodated at the laydown area driveways and existing study area intersections and roadways with no significant impact to future traffic operations on the surrounding area roadway network.**

## 1.0 INTRODUCTION

### 1.1 PROJECT DESCRIPTION

---

Horse Heaven Wind Farm, LLC (Applicant) is proposing to construct and operate the Project in unincorporated Benton County, Washington, within the Horse Heaven Hills area. The Project would consist of a renewable energy generation facility that would have a maximum grid injection capacity of up to 1,150 megawatts for a combination of wind and solar facilities, battery energy storage systems (BESS), and other Project components, including underground and overhead electrical collection lines, underground communication lines, new Project substations, access roads, operations and maintenance facilities, and meteorological towers.

At its closest point, the Project would be located approximately four miles south/southwest of the City of Kennewick and the larger Tri-Cities urban area, along the Columbia River. Figure 1 shows the current Project Lease Boundary and Project vicinity. The Project's Lease Boundary (approximately 72,428 acres) incorporates all of the parcels for which the Applicant has executed a lease to construct the turbines, solar arrays, and associated facilities. The Project's Wind Energy Micrositing Corridor encompasses 11,850 acres within the Lease Boundary and consists of the areas where the turbines and supporting facilities would be sited during the final design. The Applicant seeks authorization for an original scope of up to 244 turbine locations and a maximum of three solar arrays, with all possible turbine locations and solar arrays cumulatively reviewed to analyze potential resource impacts.

There are two options for the wind turbines (Option 1 and Option 2). The final number and location of turbines within the proposed Wind Energy Micrositing Corridor would reflect the final engineering design, model selection, and any additional avoidance and mitigation identified in the Final Environmental Impact Statement (FEIS). The specific model used would depend on the commercial availability and technology at the time of construction. The number of turbines would not exceed 244, and the maximum turbine height (at blade tip) would not exceed 671 feet. The Draft Environmental Impact Statement (DEIS) previously prepared for the Project assumed that the road disturbance associated with Turbine Option 1 and Turbine Option 2 would be identical.

As currently proposed, the Project would be built in two construction phases (Phase 1 and Phase 2). Phase 1 construction could generate power via wind and solar. Phase 1 could also include a BESS capable of storing energy. Phase 2 construction has two alternatives (Phase 2a and Phase 2b). Phase 2a could consist of the construction of both wind and solar facilities. The Applicant's Phase 2a scenario also includes the construction of a BESS. Phase 2b could increase power generation via the construction of additional wind turbines, but construction would not include a BESS or solar arrays.

During peak construction of each phase, a typical day would include the transportation of workers, materials, and movement of heavy equipment. Numerous on-site roadways are proposed to support the Project as well as two laydown areas as shown in Figure 1. The laydown areas would facilitate the delivery and assembly of materials and equipment. They would also serve as parking areas for the construction workforce. An additional tower transfer yard will be used to support the delivery of tower components prior to construction.

## 1.2 STUDY METHODOLOGY

---

The traffic study methodology was developed in consultation with representatives from the Washington Energy Facility Site Evaluation Council (EFSEC) and the Washington Department of Transportation (WSDOT) South Central Region at a traffic scoping meeting for the Project that was held virtually on June 7, 2023. The purpose of the meeting was to discuss the assumptions from the Traffic Scoping Letter (dated May 24, 2023), which identified key aspects of the traffic study including the study area roadways and intersections to be reviewed, consideration of other possible area developments and background traffic growth, and analysis required to evaluate the potential Project-related traffic impacts. The Traffic Scoping Letter is included in Appendix A.

This Traffic Impact Analysis (TIA) provides a detailed analysis of existing and future traffic operations (both with and without the proposed Project) during the weekday morning and weekday evening peak hours at the study area intersections (including the proposed site driveways at the two laydown areas) identified through consultation with EFSEC and WSDOT officials.

This study was conducted in three phases. The first phase involved an inventory of existing traffic conditions in the vicinity of the site. As part of the existing conditions assessment, peak period traffic counts were collected in June 2023. A field visit was conducted to inventory roadway and intersection geometries and traffic control as well as to observe the general operational characteristics for each of the study area intersections. WSDOT crash data was also reviewed.

The second phase of the study builds upon the data collected in the first phase and establishes the framework for evaluating potential traffic impacts associated with the Project. The following scenarios were developed to analyze these impacts.

- 2023 Existing AM/PM Peak Hours
- 2025 No Build (Without Project) AM/PM Peak Hours
- 2026 No Build (Without Project) AM/PM Peak Hours
- 2025 Phase 1 Build to Laydown Yard #1 AM/PM Peak Hours
- 2025 Phase 1 Build to Laydown Yard #2 AM/PM Peak Hours
- 2026 Phase 2 Build to Laydown Yard #2 AM/PM Peak Hours

In the third phase of this study, the existing and projected future traffic operations at each of the study intersections were analyzed to identify potential traffic operational deficiencies and, if warranted, potential improvements to mitigate the Project's peak construction traffic impacts.

## 2.0 EXISTING CONDITIONS

The effective evaluation of potential transportation impacts associated with the Project requires a thorough understanding of the existing traffic conditions on the roadways and intersections in the vicinity of the Project site. The existing conditions assessment consists of an inventory of the roadway and intersection geometries and traffic control devices; projection of peak period traffic volumes; field observations; safety analysis; review of pedestrian, bicycle; and analysis of existing traffic operations.

## 2.1 STUDY AREA ROADWAYS

---

The site is located within unincorporated Benton County, in an area known as the Horse Heaven Hills. The Project site is bisected by regional travel routes, the majority of which are owned and operated by the Washington Department of Transportation (WSDOT) and Benton County. The Project-generated construction traffic will travel to and from the site via the following key study area roadways.

**Interstate 82.** Interstate 82 (I-82) is classified as a US Interstate Highway and is under WSDOT jurisdiction. It generally runs east to west with two travel lanes in each direction between Exit 82 and Exit 113. I-82 runs north to south from Exit 113 to Exit 131. The posted speed limit is 70 miles per hour (mph) between exit 82 and exit 131. I-82 is a rural interstate. Interchanges provide access to nearby communities and cities including Prosser, Benton City, Richland, and Kennewick.

**WSDOT Route 221.** Route 221 is classified as a rural minor arterial and is under WSDOT jurisdiction. Within the study area, Route 221 provides one travel lane in each direction. The posted speed limit along Route 221 in the study area is 65 mph. Land use along this roadway is primarily agricultural with some residential and commercial uses near the intersection with Route 14.

**WSDOT Route 397.** Route 397 is classified as an urban minor arterial and is WSDOT jurisdiction. Within the study area, Route 397 provides one travel lane in each direction. The posted speed limit along Maple Street in the study area is 60 mph. Limited commercial and residential activity is found along Route 397 within the study area. Route 397 is signed as a truck route, providing access between I-82 and industrial uses in Finley and south Kennewick.

**Bofer Canyon Road.** Bofer Canyon Road is classified as a rural local access roadway and is under local jurisdiction (Benton County). Within the study area, Bofer Canyon Road provides one travel lane in each direction. Bofer Canyon Road generally runs in a north-south direction and runs parallel to I-82. The posted speed limit along North Avenue is 50 mph. Land uses along Bofer Canyon Road in the vicinity of the Project is limited to agriculture.

**Locust Grove Road.** Locust Grove Road is classified as a rural minor collector under local jurisdiction (Benton County). Within the study area, Locust Grove Road typically consists of one travel lane in each direction. Locust Grove Road runs in an east-west direction and has a generally straight alignment. The posted speed limit along Locust Grove Road is 50 mph. Land uses along Locust Grove Road include agriculture, religious and commercial uses.

**Sellards Road.** Sellards Road is classified as a rural major collector under local jurisdiction (Benton County). Within the study area, Sellards Road typically consists of one travel lane in each direction. Sellards Road runs in an east-west direction and has a generally straight alignment. The posted speed limit along Sellards Road is 50 mph. Land uses along Sellards Road consist of nearly all agricultural uses.

## 2.2 STUDY AREA INTERSECTIONS

---

The study area intersections chosen for detailed analysis were determined in consultation with the Washington Energy Facility Site Evaluation Council (EFSEC) and WSDOT. All study area intersections chosen are unsignalized. The study area intersections are shown in Figure 1 and are listed below:

- Wine Country Road at I-82 NB Ramps
- Wine Country Road at I-82 SB Ramps

- Wine Country Road at Route 22
- Route 22 at Route 221 and Paterson Avenue
- Route 221 at County Well Road
- Route 221 at Cemetery Road
- Route 221 at Sellards Road
- Webber Canyon Road at County Well Road
- Cemetery Road at Travis Road
- S. Plymouth Road at Locust Grove Road
- Route 221 at Route 14
- Route 14 at S. Plymouth Road
- Route 14 at I-82 SB Ramps
- Route 14 at I-82 NB Ramps
- Coffin Road at I-82 SB Ramps
- Coffin Road at I-82 NB Ramps
- Coffin Road at Bofer Canyon Road
- Bofer Canyon Road at Beck Road
- Locust Grove Road at I-82 SB Ramps
- Locust Grove Road at I-82 NB Ramps
- Route 397/Locust Grove Road at Bofer Canyon Road
- Route 397 at S. Owens Road
- Route 397 at S. Nine Canyon Road
- Route 397 at S. Finley Road
- Nine Canyon Road at Kirk Road
- Nine Canyon Road at Beck Road
- Nine Canyon Road at Coffin Road
- Locust Grove Road at S. Clodfelter Road
- Webber Canyon Road at Badger Road

The existing lane geometry and traffic control at each of the study area intersections is documented in the capacity analysis provided in Appendix I of this report and detailed for the key intersections below.

**Wine Country Road at I-82 Northbound Ramps.** Wine Country Road intersects the I-82 northbound ramps to form a three-way, unsignalized intersection. The Wine Country Road eastbound approach consists of a single through/right lane. The Wine Country Road westbound approach consists of a through lane and a left-turn lane. The I-82 Ramp northbound approach consists of a single shared left/right-turn lane and is under STOP control. There are currently no sidewalks or crosswalks at the intersection. Land uses adjacent to the intersection include agriculture and single-family homes.

**Wine Country Road at I-82 Southbound Ramps.** Wine Country Road intersects the I-82 southbound ramps to form a three-way, unsignalized intersection. The Wine Country Road eastbound approach consists of a single through/right lane. The Wine Country Road westbound approach consists of a through lane and a left-turn lane. The I-82 Ramp northbound approach consists of a single shared left/right-turn

lane and is under STOP control. There are currently no sidewalks or crosswalks at the intersection. Land adjacent to the intersection remains undeveloped.

**Route 22 at Wine Country Road and Chapman Lane.** Route 22 intersects Wine Country Road from the south and Chapman Lane from the north to form a four-way, unsignalized intersection. The Wine Country Road eastbound approach to the intersection consists of one left-turn lane and a shared through/right lane. The Wine Country Lane westbound approach consists of one left-turn lane and a shared through/right lane. The Route 22 northbound approach consists of a shared left/through lane and a right-turn lane. The northbound approach is under STOP control. The Chapman Lane southbound approach is opposite the Route 22 northbound approach and provides a single general-purpose lane. Chapman Lane is under STOP control. Sidewalks are located on the south side of Wine Country Road west of the intersection. Adjacent land uses are commercial (Wineries, Assisted Living Center).

**Route 22 at Route 221 and Paterson Avenue.** Route 221 intersects Route 22 from the east and Paterson Avenue from the west to form a four-way, unsignalized intersection. The Paterson Avenue eastbound approach to the intersection consists of a single general-purpose lane. The Paterson Avenue and Route 221 approaches are under STOP control. The Route 221 westbound approach consists of a single general-purpose lane. The Route 22 northbound approach consists of one left-turn lane and a shared through/right-turn lane. The Route 22 southbound approach one left-turn lane and a shared through/right-turn lane. There are currently no sidewalks or crosswalks at the intersection. Adjacent land uses to the intersection consist of commercial and residential (single family home) uses.

**Route 221 at County Well Road.** County Well Road approaches Route 221 from the northeast to form a three-way, unsignalized intersection. The Route 221 southeast and northwest approaches each consist of a single general-purpose lane. The County Well Road southwest approach consists of a single general-purpose lane and is under STOP control. There are currently no sidewalks or crosswalks at the intersection. Agricultural land uses surround the study intersection.

**Route 221 at Cemetery Road.** Route 221 intersects Cemetery Road from the north and south to form a four-way, unsignalized intersection. The Cemetery Road eastbound and westbound approaches consist of a single lane and are under STOP control. The Route 221 northbound and southbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Agricultural land uses surround the study intersection.

**Route 221 at Sellards Road.** Route 221 intersects Sellards Road from the north and south to form a four-way, unsignalized intersection. The Sellards Road eastbound and westbound approaches consist of a single lane and are under STOP control. The Route 221 northbound and southbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Agricultural land uses surround the study intersection.

**Webber Canyon Road at County Well Road.** County Well Road approaches Webber Canyon Road from the southwest to form a three-way, unsignalized intersection. The Webber Canyon Road southeast and northwest approaches each consist of a single general-purpose lane. The County Well Road northeast approach consists of a single general-purpose lane and is under STOP control. There are currently no sidewalks or crosswalks at the intersection. Agricultural land uses surround the study intersection.

**Cemetery Road at Travis Road.** Travis Road intersects Cemetery Road from the north and south to form a four-way, unsignalized intersection. The Cemetery Road eastbound and westbound approaches each consist of a single travel lane under STOP control. The Travis Road northbound and southbound

approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Agricultural land uses surround the study intersection.

**S. Plymouth Road at Locust Grove Road.** Locust Grove Road intersects Plymouth Road from the east to form a three-way, unsignalized intersection. The Locust Grove Road westbound approach consists of a single lane and is under STOP control. The Plymouth Road northbound and southbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Agricultural land uses surround the study intersection.

**Route 221 at Route 14.** Route 221 and Paterson Road intersect Route 14 from the north and south to form a four-way, unsignalized intersection. The Route 14 eastbound approach consists of a single lane general-purpose lane. The Route 14 westbound approach consists of a shared left-turn/through lane and a right-turn lane. The Paterson Road northbound approach consists of a single general-purpose lane under STOP control. The Route 221 southbound approach consists of a single general-purpose lane under STOP control. There are currently no sidewalks or crosswalks at the intersection. Commercial and residential land uses are present north of the intersection.

**Route 14 at S. Plymouth Road.** S. Plymouth Road intersects Route 14 from the north and south to form a four-way unsignalized intersection. The S. Plymouth Road northbound and southbound approaches each consist of a single general-purpose lane and operate under STOP control. The Route 14 eastbound and westbound approaches each consist of a left-turn lane and a shared thru/right-lane. There are currently no sidewalks or crosswalks at the intersection. Commercial and residential land uses are present north of the intersection.

**Route 14 at I-82 Southbound Ramps.** The I-82 southbound on- and off-ramps intersect Route 14 from the north and south to form a four-way unsignalized intersection. The southbound off-ramp approach consists of a single general-purpose lane and operate under STOP control. The Route 14 eastbound and westbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Route 14 at I-82 Northbound Ramps.** The I-82 northbound on- and off-ramps intersect Route 14 from the north and south to form a four-way unsignalized intersection. The northbound off-ramp approach consists of a single general-purpose lane and operate under STOP control. The Route 14 eastbound and westbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Coffin Road at I-82 Southbound Ramps.** The I-82 southbound on- and off-ramps intersect Coffin Road from the north and south to form a four-way unsignalized intersection. The southbound off-ramp approach consists of a single general-purpose lane and operate under STOP control. The Coffin Road eastbound and westbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Coffin Road at I-82 Northbound Ramps.** The I-82 northbound on- and off-ramps intersect Coffin Road from the north and south to form a four-way unsignalized intersection. The northbound off-ramp approach consists of a single general-purpose lane and operate under STOP control. The Coffin Road eastbound and westbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Coffin Road at Bofer Canyon Road.** Bofer Canyon Road intersects Coffin Road from the north and south to form a four-way unsignalized intersection. The Bofer Canyon Road approaches each consist of a single general-purpose lane and operate under STOP control. The Coffin Road eastbound and westbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection is partially used for agriculture.

**Bofer Canyon Road at Beck Road.** Bofer Canyon Road intersects Beck Road from the north and south to form a four-way unsignalized intersection. The Bofer Canyon Road approaches each consist of a single general-purpose lane and operate under STOP control. The Beck Road eastbound and westbound approaches each consist of a single general-purpose lane and operate under STOP control. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection is partially used for agriculture.

**Locust Grove Road at I-82 Southbound Ramps.** The I-82 southbound on- and off-ramps intersect Locust Grove Road from the north and south to form a four-way unsignalized intersection. The southbound off-ramp approach consists of a single general-purpose lane and operate under STOP control. The Locust Grove Road eastbound and westbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Locust Grove Road at I-82 Northbound Ramps.** The I-82 northbound on- and off-ramps intersect Locust Grove Road from the north and south to form a four-way unsignalized intersection. The northbound off-ramp approach consists of a single general-purpose lane and operate under STOP control. The Locust Grove Road eastbound and westbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Route 397/Locust Grove Road at Bofer Canyon Road.** Bofer Canyon Road intersects Locust Grove Road/Route 397 from the north and south to form a four-way unsignalized intersection. The Bofer Canyon Road approaches each consist of a single general-purpose lane and operate under STOP control. The Locust Grove Road eastbound and Route 397 westbound approaches each consist of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection is partially used for agriculture.

**Route 397 at S. Owen Road.** S. Owens Road intersects Route 397 from the north to form a three-way unsignalized intersection. The S. Owens Road southbound approach consists of a left-turn lane and a right-turn lane and operates under STOP control. The Route 397 eastbound approach consists of a left-turn lane and a through travel lane. The Route 397 westbound approach consists of a single general-purpose lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Route 397 at S. Nine Canyon Road.** S. Nine Canyon Road intersects Route 14 from the north and south to form a four-way unsignalized intersection. The S. Nine Canyon Road northbound approach consists of a shared left-turn/through lane and a channelized right-turn lane all of which operate under STOP control. The S. Nine Canyon Road southbound approach consists of a single general-purpose travel lane which operates under STOP control. The Route 397 eastbound and westbound approaches each consist of a left-turn lane and a shared thru/right lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Route 397 at S. Finley Road.** S. Finley Road intersects Route 14 from the south to form a three-way unsignalized intersection. The S. Finley Road northbound approach consists of a single general-purpose travel lane which operates under STOP control. The Route 397 westbound approach consists of a left-turn lane and a through travel lane. The Route 397 eastbound approach consists of a shared through/right-turn lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection remains undeveloped.

**Nine Canyon Road at Kirk Road.** Kirk Road intersects Nine Canyon Road from the east to form a three-way unsignalized intersection. The Kirk Road westbound approach consists of a single general-purpose travel lane which operates under STOP control. The Nine Canyon Road northbound and southbound approaches each consist of a single general-purpose travel lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection is used for agricultural purposes.

**Nine Canyon Road at Beck Road.** Beck Road intersects Nine Canyon Road from the west to form a three-way unsignalized intersection. The Beck Road eastbound approach consists of a single general-purpose travel lane which operates under STOP control. The Nine Canyon Road northbound and southbound approaches each consist of a single general-purpose travel lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection is used for agricultural purposes.

**Nine Canyon Road at Coffin Road.** Coffin Road intersects Nine Canyon Road from the west to form a three-way unsignalized intersection. The Coffin Road eastbound approach consists of a single general-purpose travel lane which operates under STOP control. The Nine Canyon Road northbound and southbound approaches each consist of a single general-purpose travel lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection is used for agricultural purposes.

**Locust Grove Road at S. Clodfelter Road.** A four-way unsignalized intersection is created by the junction of S. Clodfelter Road (from the north and west), Locust Grove from the east and C Williams Road from the south. The S. Clodfelter Road southbound approach and the C Williams northbound approach each consist of a single travel lane and operate under STOP control. The eastbound S. Clodfelter Road approach and the westbound Locust Grove Road approach each consist of a single general-purpose travel lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection is used for agricultural purposes.

**Webber Canyon Road at Badger Road.** Badger Road intersects Webber Canyon Road from the northeast to form a three-way unsignalized intersection. The Badger Road southwest approach consists of a single general-purpose travel lane which operates under STOP control. The Webber Canyon Road north-westbound and south-eastbound approaches each consist of a single general-purpose travel lane. There are currently no sidewalks or crosswalks at the intersection. Land surrounding the intersection is used for agricultural purposes.

## 2.3 EXISTING TRAFFIC VOLUMES

---

Peak period intersection turning movement counts (TMCs) and automatic traffic recorder (ATR) counts were collected on June 13<sup>th</sup> and June 14<sup>th</sup> 2023 in the vicinity of the Project site. Existing continuous count stations along Route 221 and I-82 under the jurisdiction of WSDOT were used to supplement collected traffic count data.

### 2.3.1 Daily Traffic Volumes

ATR counts were conducted along following roadway segments within the study area:

1. I-82 (north of Coffin Road)
2. Route 397 (west of Nine Canyon Road)
3. Route 221 (south of Sellards Road)
4. Bofer Canyon Road (north of Coffin Road)
5. Nine Canyon Road (south of Route 397)
6. Locust Grove Road (between Nicosin Road and I-82)
7. Travis Road (north of Sellards Road)
8. Plymouth Road (north of Route 14)
9. Sellards Road (between Route 221 and Tyack Road)
10. Badger Canyon Road (north of Sellards Road)

The ATR data collected provides the basis the Roadway Segment Analysis to be discussed in Section 4.2. A summary of existing daily traffic volumes by direction is provided in Table 1. The ATR traffic volume data is provided in Appendix B.

**Table 1. Weekday Daily Traffic Volume Summary**

Location		Weekday ADT (vpd) <sup>1</sup>	AM Peak Hour (vph) <sup>2</sup>	PM Peak Hour (vph)
<b>I-82 (North of Coffin Road)</b>	Northbound	12,650	1,056	767
	Southbound	<u>12,345</u>	<u>236</u>	<u>1,420</u>
	<b>Total</b>	<b>24,995</b>	<b>1292</b>	<b>2,187</b>
<b>Route 397 (West of Nine Canyon Road)</b>	Eastbound	670	42	54
	Westbound	<u>696</u>	<u>48</u>	<u>51</u>
	<b>Total</b>	<b>1,366</b>	<b>90</b>	<b>105</b>
<b>Route 221 South of Sellards Road)</b>	Northbound	1,298	32	200
	Southbound	<u>1,359</u>	<u>180</u>	<u>84</u>
	<b>Total</b>	<b>2,657</b>	<b>212</b>	<b>284</b>
<b>Bofer Canyon Road (North of Coffin Road)</b>	Northbound	25	0	5
	Southbound	<u>14</u>	<u>1</u>	<u>0</u>
	<b>Total</b>	<b>39</b>	<b>1</b>	<b>5</b>
<b>Nine Canyon Road (South of Route 397)</b>	Northbound	120	1	14
	Southbound	<u>133</u>	<u>18</u>	<u>10</u>
	<b>Total</b>	<b>253</b>	<b>19</b>	<b>24</b>
<b>Locust Grove Road (Between Nicosin Road and I-82)</b>	Eastbound	349	12	51
	Westbound	<u>242</u>	<u>36</u>	<u>10</u>
	<b>Total</b>	<b>591</b>	<b>48</b>	<b>61</b>
<b>Travis Road (North of Sellards Road)</b>	Northbound	402	13	55
	Southbound	<u>335</u>	<u>35</u>	<u>20</u>
	<b>Total</b>	<b>737</b>	<b>48</b>	<b>75</b>
<b>S. Plymouth Road (North of Route 14)</b>	Northbound	675	21	55
	Southbound	<u>677</u>	<u>52</u>	<u>60</u>
	<b>Total</b>	<b>1,352</b>	<b>73</b>	<b>115</b>
<b>Sellards Road (Between Route 221 and Tyack Road)</b>	Eastbound	566	28	55
	Westbound	<u>482</u>	<u>40</u>	<u>41</u>
	<b>Total</b>	<b>1,048</b>	<b>68</b>	<b>96</b>
<b>Badger Canyon Road (North of Sellards Road)</b>	Northbound	43	2	8
	Southbound	<u>25</u>	<u>1</u>	<u>1</u>
	<b>Total</b>	<b>68</b>	<b>3</b>	<b>9</b>

Based on automatic traffic recorder counts collected on June 13th, 2023. <sup>1</sup>vpd = vehicles per day <sup>2</sup>vph = vehicles per hour

The ATR traffic volume data is provided in Appendix B.

### 2.3.2 Peak Hour Traffic Volumes

The combined critical peak demand periods of Project-related construction traffic and adjacent street traffic will occur during the weekday morning and weekday evening midday peak hours. The TMC data was collected during the typical weekday from 5:00 AM to 8:00 AM and 4:00 PM to 8:00 PM. The turning movement count data sheets are provided in Appendix B.

## 2.4 PEDESTRIAN AND BICYCLE ACCOMMODATIONS

---

Within the study area, limited pedestrian and bicycle infrastructure is provided. Sidewalks exist only on the south side of Wine Country Road west of Route 22. There are no marked or signalized pedestrian crossings within the study area. There are currently no dedicated bike lanes or shared bike lanes (sharrows) along study area routes. The Tri-Cities Bicycle Map, created by the Benton-Franklin Council of Governments, recommends routes which use study area roadways including Route 397, Bofer Canyon Road, S. Clodfelter Road and Travis Road. During construction, roadways should remain open and accessible for all roadway users.

## 2.5 TRAFFIC SAFETY ANALYSIS

---

Crash data for the study area intersections was obtained from WSDOT via the crash request center for the most recent five-year period available (2018 through 2022). Crash data summaries received from WSDOT included severity, type of crash, weather conditions, road surface condition, time, and date.

**ITE Million Entering Vehicles (MEV) Method.** In this analysis crashes are measured based on frequency per million entering vehicles (MEV). This ratio is a function of the average daily traffic entering the intersection and the annual frequency of accidents. This method of analysis is used to identify areas that need further review. A typical review threshold for accidents at an intersection is 1.00 accidents per MEV. Peak Hour TMCs collected as part of this study were grown to estimate entering average daily traffic volumes. A summary of the accident data for the intersections within the study area are shown in Table 2. The crash data, if any, and crash rate calculations for each study intersection are provided in Appendix C. A brief description of the crash history for the five-year study period reviewed for each of the study area intersections is provided below.

$$\text{Rate per MEV} = \frac{\text{number of crashes in five years} \times 1 \text{ million}}{\text{PM Peak Hour Volume} \times \text{PM Peak Hour Factor (0.09)} \times 365 \times 5 \text{ years}}$$

Crashes resulting in fatalities were reported at the following intersections in the study area: Route 221 at Sellards Road & Route 14 at S. Plymouth Road. The fatality at Route 221 and Sellards Road occurred on August 8th, 2021, at approximately 8:15 PM due to a motorist failing to stop while heading westbound on Sellards Road causing an angle collision. The fatality at Route 14 and S. Plymouth Road occurred on July 22<sup>nd</sup>, 2022 at approximately 4:30 AM due to an angle collision when a motorist failed to stop while travelling on Plymouth Road northbound.

Table 2. Crash Data Summary (2018-2022)

## 2.5.1 Highway Safety Manual Safety Performance Summary

Tetra Tech conducted a traffic safety analysis for each of the study area intersections based on procedures outlined in the Safety Analysis Guide published by WSDOT using the Highway Safety Manual (HSM) spreadsheet tool, version 9.1 (<http://safetyperformance.org/tools/>). The HSM tool is used to calculate the Predicted Crash Frequency and the Expected Crash Frequency.

The Predicted Crash Frequency is developed based on consideration of the intersection geometry (number of lanes approaching the intersection including turn lanes, if present), intersection layout (angle of the intersecting streets), provision (or absence of) street lighting, and average annual daily traffic (AADT) volumes at the intersection. The Predicted Crash Frequency represents the average safety performance experienced at intersections with similar design characteristics and traffic volumes, expressed in crashes per year.

The Expected Crash Frequency is developed based on the same factors as above but also considers the average reported crash frequency at the intersection (over the past five years). This includes an assessment of the severity of crashes (i.e. crashes involving personal injury and/or fatalities versus crashes that result in property damage only). This analysis is considered a more reliable metric of existing or actual average crash performance, measured in crashes per year.

The Predicted Crash Frequency for each intersection is then subtracted from the Expected Crash Frequency to identify intersections with the highest potential for safety improvement. A net difference greater than zero indicates intersections that are likely to experience more crashes than typical intersections with similar roadway characteristics and traffic volumes, and highest potential to reduction of fatal and serious injury crashes and return the greatest benefit for the cost of a safety Project. The HSM crash frequency calculations are provided in Appendix C of this report. A comparison of the Predicted Crash Frequency and Expected Crash Frequency for each of the study area intersection are presented in Tables 3 and 4.

**Table 3. Highway Safety Manual Predictive/Expected Safety Performance Summary**

**Table 4. Highway Safety Manual Predictive/Expected Safety Performance Summary – Key Locations**

Intersection	Crash Severity	Crash Frequency (Crashes/Year)		
		Predicted (Geometry/Volume)	Expected (Geometry/Volume/ Crash History)	Potential for Improvement
Route 221 at Sellards Road	Fatal & Injury	0.6	0.9	0.3
	PDO	0.8	1.2	0.3
	Total	1.5	2.1	0.6
Route 221 at Route 14	Fatal & Injury	0.7	0.8	0.1
	PDO	1.0	1.1	0.1
	Total	1.7	1.9	0.2
Route 14 at S. Plymouth Road	Fatal & Injury	0.6	0.7	0.2
	PDO	0.7	1.0	0.2
	Total	1.3	1.7	0.4
Webber Canyon Road at Badger Road	Fatal & Injury	0.2	0.3	0.1
	PDO	0.3	0.5	0.2
	Total	0.5	0.8	0.3

As shown in Table 4, the HSM analysis indicates that four of the study area intersections have higher Expected Crash Frequencies than average for intersections with similar design features and traffic volumes with potential for improvement. These include the following locations:

- Route 221 at Sellards Road
- Route 221 at Route 14
- Route 14 at S. Plymouth Road
- Webber Canyon Road at Badger Road

The next step in the traffic safety review is to evaluate potential measures to reduce the Predicted and Expected Crash Frequencies at the four high crash frequency intersections. A summary of the potential safety improvements at the high crash frequency locations is presented in Figure 33 (as discussed in more detail in Section 4.4). The potential reduction in the Predicted and Expected Crash Frequencies associated with each of the potential traffic safety mitigation measures at these intersections is summarized in Table 5.

Table 5. Predicted Effectiveness of Potential Safety Improvements

Roadway/Direction	2023 Existing Results		Add Street Lighting		Add Right-Turn Lanes		Add Left-Turn Lanes		Overall Mitigation Predicted Average Crash Frequency	Overall Mitigation Expected Average Crash Frequency
	Predicted Average Crash Frequency	Expected Average Crash Frequency	Predicted Average Crash Frequency	Expected Average Crash Frequency	Predicted Average Crash Frequency	Expected Average Crash Frequency	Predicted Average Crash Frequency	Expected Average Crash Frequency

Source: Tetra Tech; Based on Highway Safety Manual Chapter 10 Spreadsheet for two-way rural roads (v.9, 2016). Five-year crash history was provided by WSDOT. Traffic Counts were collected in June 2023.  
N/A - Mitigation measures are already in place at these locations and were therefore not considered as potential improvements.

## 2.5.2 Sight Distance Analysis

Tetra Tech reviewed the available sight distance at the four study area intersections identified in the safety analysis to determine whether or not insufficient sight distance may be adversely affecting the safety at these intersections. The available sight distance was determined based on procedures outlined in *A Policy On Geometric Design of Highways and Streets*, published by the American Association of State Highway and Transportation Officials (AASHTO). Tetra Tech then compared the available sight distance to the required Stopping Sight Distance (SSD) for the anticipated travel speeds for vehicle traveling past the site.

85<sup>th</sup> percentile travel speed data was available from WSDOT (Continuous Count Station: P17) along Route 221. At all other locations the posted speed limit was used in the Sight Distance Analysis. A summary of the available and required SSD at the four study area intersections identified in the safety analysis is presented in Table 6.

**Table 6. Sight Distance Summary**

Intersection	Assumed Speed (mph)	Approx. Grade	AASHTO Desirable (feet) <sup>1</sup>	Estimated Distance (feet)	Meets AASHTO Desirable
<b>Route 221 at Sellards Road</b>					
<u>Stopping Distance</u>					
From the North	72 <sup>2</sup>	-1.1	780	1000+	Yes
From the South	71 <sup>2</sup>	1.2	730	1000+	Yes
<b>Route 14 at Route 221</b>					
<u>Stopping Distance</u>					
From the East	65 <sup>3</sup>	-0.5	650	1000+	Yes
From the West	65 <sup>3</sup>	0.9	635	1000+	Yes
<b>Washington Street/Proposed Southerly Site Driveway</b>					
<u>Stopping Distance</u>					
From the East	55 <sup>3</sup>	-0.3	495	1000+	Yes
From the West	55 <sup>3</sup>	0.6	490	1000+	Yes
<b>Route 16/Truck Access Driveway</b>					
<u>Stopping Distance</u>					
From the North	40 <sup>3</sup>	-0.5	305	1000+	Yes
From the South	50 <sup>3</sup>	-0.3	430	650+	Yes

<sup>1</sup>Obtained from A Policy On Geometric Design of Highways and Streets, 2018 Edition, published by the American Association of State Highway and Transportation Officials (Exhibit 3-1) for the assumed travel speeds for required stopping sight distance and desirable intersection sight distance based on roadway grades.

<sup>2</sup>Assumed Speeds at Route 221 & Sellards Road is the Observed 85% speed.

<sup>3</sup>Assumed Speed are the Posted Speed Limit.

As shown in Table 6, the available sight distance at each of the study area intersections exceeds the minimum AASHTO-required stopping sight distance for the assumed travel speed. The sight distance calculations are included in Appendix D.

## 3.0 FUTURE CONDITIONS

To determine future traffic demands on the study area roadways, the 2023 Existing weekday morning and weekday evening peak hour traffic volumes were projected to the future design years of 2025 for Phase 1 and 2026 for Phase 2. Independent of the proposed Project, the future No Build (Without Project) traffic volumes are assumed to include all existing traffic as well traffic increases resulting from general background traffic growth and other planned development Projects in the vicinity of the site.

The following section of the report provides a detailed description of the development of the future peak hour traffic projections and other factors influencing the future traffic conditions in the vicinity of the Project site.

### 3.1 FUTURE NO BUILD CONDITIONS

---

The future No Build (Without Project) condition establishes the basis for evaluating the transportation impacts associated with the proposed Project. The No Build condition includes the effects of general area growth, other planned development Projects and planned transportation improvements expected to be completed by the Design Year of 2025 for Phase 1 and 2026 for Phase 2.

To establish the future 2025 and 2026 No Build traffic volumes, the 2023 Existing condition traffic volumes were projected to the 2025 and 2026 design years, by which time the Project is expected to be under construction. Traffic growth is primarily a function of changes in motor vehicle use and expected land development in the region. To predict a rate at which traffic on the roadways in the vicinity of the site can be expected to grow during the two- and three-year forecast period (2023 to 2025 and 2023 to 2026), both historic traffic growth and planned area developments were examined. A discussion of the development of the future No Build (Without Project) conditions is provided below.

#### 3.1.1 General Background Traffic Growth

A general background growth rate was applied to the 2023 Existing condition traffic volumes based on a review of the Washington Department of Transportation (WSDOT) permanent count station data and in consultation with WSDOT. The permanent count station P17, Route 221 indicates declining traffic volumes since 2018 and the permanent count station Location P09, I-82 indicates no growth in traffic volumes since 2021. However, to provide a conservative assessment, an annual growth rate of 1.0 percent per year was assumed for this study. This is consistent with the growth rate recommendations provided by WSDOT. The background traffic growth rate data is provided in Appendix E.

#### 3.1.2 Background Development

Other planned area developments could also result in increased traffic on the surrounding area roadways. Tetra Tech coordinated with WSDOT and Benton County planning staff to determine background development projects approved or under construction that may need to be considered in the development of future year traffic volumes. The County and State did not identify any additional background development projects within the study area.

### 3.1.3 Planned Roadway Improvements

Based on consultation with Benton County, County Well Road is slated for reconstruction as part of the Transportation Improvement Program. County Well Road is planned to be reconstructed from a gravel roadway to an all-weather paved road with improved guard rails and drainage over the course of three phases. Phase 1 is planned for 2024 and phases 2 and 3 are planned for 2026 and 2027, respectively. Phase 1 will reconstruct County Well Road between Route 221 and McBee Road. Phase 2 will occur between McBee Road and Clodius Road. Phase 3 will occur between Clodius Road and Travis Road.

No other major planned roadway improvements within the study area need to be considered for the 2026 No Build conditions.

### 3.1.4 Future 2025/2026 No Build Traffic Volumes

The 2023 Existing condition peak hour traffic volumes were grown by 1.0 percent per year over the two-year study horizon to establish the 2025 No Build (Without Project) traffic volumes. Similarly, the 2023 Existing condition peak hour traffic volumes were grown by 1.0 percent per year over the three-year study horizon to establish the 2026 No Build (Without Project) traffic volumes. The 2025 No Build weekday morning and weekday evening peak hour traffic volume networks are illustrated in Figures 5 and 6, respectively. The 2026 No Build weekday morning and weekday evening peak hour traffic volume networks are illustrated in Figures 7 and 8, respectively.

## 3.2 FUTURE BUILD CONDITIONS

---

To assess the potential transportation-related impacts associated with the Project's peak construction activities, the overall travel demands were determined based on proposed site access as well as the anticipated trip generation, travel mode split, trip distribution and trip assignment. The Project's travel demand was then added to the future 2025 and 2026 No Build traffic volumes (without the Project) to develop the future 2025 and 2026 Build condition traffic volumes (with the Project's peak construction activity). A discussion of the development of the future Build condition is provided below.

### 3.2.1 Project-Generated Trips

The Project will consist of three stages: construction, O&M, and decommissioning. The highest volume of site-related trips will occur during the peak construction phase of the Project. Therefore, the Traffic Impact Analysis (TIA) will be based on the vehicle trip generation associated with the peak construction phase workforce levels.

Preliminary vehicle trip generation estimates were included in the Project's Application for Site Certification (ASC). These estimates were further refined as part of the Project Traffic Scoping Letter (TSL) to inform the study area and be used as the basis for analysis in the TIA. Construction of the proposed energy facility is expected to include grading, panel installation, inspections, and equipment deliveries.

Peak construction activities are currently anticipated to occur for only a portion of each the two successive 11-month periods. To account for peak construction activities, the anticipated average daily workforce levels (374 workers on site per day) was multiplied by a factor of 1.25. Therefore, it is anticipated that at peak operations, the site could experience construction workforce levels of up to 467 construction workers at one time. Construction hours of operation are assumed to generally be 7:00 AM to 7:00 PM with the majority of construction workers arriving prior to 7:00 AM and departing after 7:00 PM. Since the peak hours of the adjacent street traffic are expected to occur sometime during the peak commuting periods of 7:00 AM to

9:00 AM and 4:00 PM to 6:00 PM, it is expected that the majority of construction workers would arrive and depart the site outside of the typical weekday morning and weekday evening commuter peak hours of the adjacent streets.

However, to present a conservative assessment of potential traffic increases associated with the Project, it is assumed that all of the construction workers would arrive during the weekday morning peak hour and depart during the weekday evening peak hour. The remainder of the construction periods is anticipated to generate fewer vehicle trips.

There are no public transportation services in the vicinity of the Project site that are anticipated to be used for the Project. Therefore, for the purposes of this assessment, it was assumed that no construction workers would use public transit to access the site. Additionally, it is anticipated that some construction workers would arrive and depart the site together (carpooling). For purposes of this assessment, it was assumed that the average vehicle would have 1.25 occupants to represent carpooling to/from the site.

There are currently two alternatives being considered for Phase 2 of the Project construction. Table 7 presents a summary of the trip generation estimates for the proposed Project's peak construction workforce activities by phase. The more conservative trip generation of the two Phase 2 alternatives (Phase 2a) will be used for the TIA analyses.

<b>Total</b>	<b>374</b>	<b>26</b>	<b>400</b>	<b>344</b>	<b>20</b>	<b>364</b>	<b>330</b>	<b>22</b>	<b>352</b>

- 1) Based on the Horse Heaven Wind Farm Updated ASC (December 2022).
- 2) Used ASC estimated maximum Phase 1 peak period worker vehicle trips of 374. Weekday daily workforce traffic volumes account for all workers travelling within the site from the laydown yard to the worksite and back before heading home.
- 3) Used ASC estimated maximum Phase 1 250 truck trips per day. Used ASC assumption of 5% of daily truck trips occur during the peak hours.
- 4) Used ASC estimated maximum Phase 2a peak period worker vehicle trips of 344. Weekday daily workforce traffic volumes account for all workers travelling within the site from the laydown yard to the worksite and back before heading home.
- 5) Used ASC estimated maximum Phase 2a 200 truck trips per day. Used ASC assumption of 5% of daily truck trips occur during the peak hours.
- 6) Used ASC estimated maximum Phase 2b peak period worker vehicle trips of 330. Weekday daily workforce traffic volumes account for all workers travelling within the site from the laydown yard to the worksite and back before heading home.
- 7) Used ASC estimated maximum Phase 2b 206 truck trips per day. Used ASC assumption of 5% of daily truck trips occur during the peak hour.

### 3.2.2 Trip Distribution

Tetra Tech has developed separate trip distribution patterns for the Project's peak construction activities at the two proposed laydown areas. The trip distribution patterns were developed based on consideration of the effective population within the anticipated employment workforce (approximate two-hour drivetime zone) and the currently proposed location of the laydown area for each phase.

For purposes of this study, it is assumed that construction workers will come from within a draw area of an approximately two-hour drivetime zone due to the demand for skilled laborers onsite. To estimate the distribution patterns for the construction phases, cordon lines were drawn around the site and the cities and towns within the draw area were each assigned a route (or routes, if more than one seemed appropriate) to travel to/from the site. The routes were determined based on travel patterns during peak commuting periods. The populations of each of the cities or towns within the draw area was determined using available US Census population data and used as a method of "weighting" the trip distribution of each of the likely routes to the site. Cities and towns with a less than 30-minute drive to the site were weighted fully. As the travel time to the site increased, its effective population decreased. Populations greater than two-hour drivetimes from the site were considered to not have an effect on the model. The calculated trip distribution patterns are shown in Table 8.

**Table 8. Trip Distribution Summary**

Roadway/Direction	Laydown Yard 1		Laydown Yard 2	
	Entering Distribution	Exiting Distribution	Entering Distribution	Exiting Distribution
Sellards Road to/from the West	1%	1%	1%	1%
Route 221 to/from the West	0%	0%	18%	18%
Webber Canyon Road to/from North	0%	0%	17%	17%
S. Clodfelter Road to/from North	0%	0%	21%	21%
I-82 to/from North	52%	52%	1%	1%
Route 395 to/from North	25%	25%	22%	22%
S. Olympia Street to/from North	5%	5%	3%	3%
Route 397 to/from North	1%	1%	1%	1%
Bofer Canyon Road to/from South	16%	16%	0%	0%
S. Plymouth Road to/from South	0%	0%	16%	16%
Route 221 to/from South	0%	0%	0%	0%
<b>Total</b>	<b>100%</b>	<b>100%</b>	<b>100%</b>	<b>100%</b>

In general, the analysis indicates that the majority of Project trips will arrive/depart the site from the north. The entering and exiting Project construction workforce trip distribution patterns to Laydown Yard 1 are shown in Figures 9 and 10, respectively. The entering and exiting Project construction workforce trip distribution patterns to Laydown Yard 2 are shown in Figures 11 and 12, respectively. The distribution analysis is included in Appendix F.

The Project trips associated with the two construction phases were then assigned to the study area roadway network based on the Project distribution patterns presented in Figures 9 through 12. The resulting construction traffic volumes are presented in Figures 13 through 18.

- Figure 13 - Phase 1 to Laydown Yard #1 Weekday Morning Peak Hour Trips

### 3.2.3 Build (With Project) Peak Hour Traffic Volumes

The new trips associated with the proposed Project were then added to the 2025 Phase 1 and 2026 Phase 2 No Build (Without Project) traffic volumes. The resulting 2025 Build (Phase 1) and 2026 Build (Phase 2) weekday morning and weekday evening peak hour traffic volumes are presented in Figures 19 through 24.

### 3.2.4 Construction Traffic Impacts to High Frequency Crash Intersections

Based on a detailed review of the anticipated trip generation and trip distribution patterns associated with each phase of construction, the proposed Project is not anticipated to result in any new traffic at the four high frequency crash locations identified above until the later stage of Phase I (for the Phase 1 construction sites located on the west side of I-82 served by Laydown Yard 2). The Project is also expected to result in minor additional traffic increases at the four high frequency crash locations during Project construction Phase 2, albeit with fewer traffic increases than during Project construction Phase 1. Before construction begins, advanced warning signage should be implemented throughout the study area alerting motorists to expect additional truck activity. Figure 35 shows a draft Temporary Construction Warning Signage Plan which includes potential advanced warning signage near the four intersections with high crash frequency. The final Temporary Construction Warning Signage Plan will be prepared in coordination with WSDOT as part of the Applicant's Construction Traffic Management Plan (CTMP).

#### 3.2.4.1 Auxiliary Lane Warrant Analysis

Tetra Tech conducted Auxiliary Lane Warrant analyses at the four high frequency crash locations for the following conditions based on the WSDOT Design Manual. The weekday morning and evening commuter peak hour traffic volumes for the following conditions were estimated for the following conditions:

- 2023 Existing
- Future 2025 Build Phase I to Laydown Yard 2 (worst-case construction traffic volume condition)

The traffic volume inputs and resulting left-turn and right-turn lane warrant analyses for the 2023 Existing and Projected 2025 Build Phase I to Laydown Yard 2 weekday morning and weekday evening commuter peak hours conditions are provided in Appendix G. A summary of the Auxiliary Lane Warrant analysis is presented in Table 9.

Table 9. Auxiliary Turn Lane Warrant Analysis

2023 Existing Conditions - Weekday Morning Peak Hour								
	Route 221 at Sellards Road		Route 221 at Route 14		Route 14 at S. Plymouth Road		Webber Canyon Road at Badger Road	
	Northbound	Southbound	Eastbound	Westbound	Eastbound	Westbound	Northbound	Southbound
Left-Turn Lane Warranted? <sup>1</sup>	No	No	No	No	No	No	N/A	No
Right-Turn Lane Warranted? <sup>2</sup>	No	No	No	Yes	No	No	No	N/A
2023 Existing Conditions - Weekday Afternoon Peak Hour								
	Route 221 at Sellards Road		Route 221 at Route 14		Route 14 at S. Plymouth Road		Webber Canyon Road at Badger Road	
	Northbound	Southbound	Eastbound	Westbound	Eastbound	Westbound	Northbound	Southbound
Left-Turn Lane Warranted? <sup>1</sup>	No	No	No	No	No	No	N/A	No
Right-Turn Lane Warranted? <sup>2</sup>	No	No	No	No	No	Yes	No	N/A
2021 Phase 1 to Laydown Yard 2 - Weekday Morning Peak Hour								
	Route 221 at Sellards Road		Route 221 at Route 14		Route 14 at S. Plymouth Road		Webber Canyon Road at Badger Road	
	Northbound	Southbound	Eastbound	Westbound	Northbound	Southbound	Eastbound	
Left-Turn Lane Warranted? <sup>1</sup>	No	No	No	No	No	No	N/A	No
Right-Turn Lane Warranted? <sup>2</sup>	No	No	No	Yes	No	Yes	No	N/A
2025 Phase 1 to Laydown Yard 2 - Weekday Afternoon Peak Hour								
	Route 221 at Sellards Road		Route 221 at Route 14		Route 14 at S. Plymouth Road		Webber Canyon Road at Badger Road	
	Northbound	Southbound	Eastbound	Westbound	Eastbound	Westbound	Northbound	Southbound
Left-Turn Lane Warranted? <sup>1</sup>	No	No	No	No	No	No	N/A	No
Right-Turn Lane Warranted? <sup>2</sup>	No	No	No	No	No	Yes	No	N/A

Notes:

1) Left-Turn Lane Warrant Analysis Based on WSDOT Design Manual 22-01.21 Chapter 1310 Exhibit 7.

2) Right-Turn Lane Warrant Analysis Based on WSDOT Design Manual 22-01.21 Chapter 1310 Exhibit 19.

3) N/A = Not Applicable

As shown in Table 9, the 2023 Existing and Projected 2025 Build Phase I to Laydown Yard 2 weekday commuter peak hour traffic volumes at the intersections of Route 221 and Sellards Road, Webber Canyon Road and Badger Road, fall below the minimum traffic volume warrant thresholds for installation of either a separate left-turn or right-turn lane. The Auxiliary Lane Warrant Analysis also indicates that the intersection of Route 221 and Route 14 currently satisfies the minimum traffic volume warrant threshold for the consideration of a right-turn lane on the Route 14 westbound approach to the intersection with Route 221, during the weekday morning peak hour condition. This intersection currently provides a short right-turn lane on the Route 14 westbound approach, with no deceleration lane provided. However, the proposed Project is not expected to result in any additional vehicles trips to the intersection during either the weekday morning peak hour or weekday afternoon commuter peak hour. Consequently, no geometric improvements are currently proposed at these intersections as part of the Horse Heaven Wind Farm Project.

The Auxiliary Lane Warrant Analysis indicates that the intersection of Route 14 and S. Plymouth Road currently satisfies the minimum traffic volume warrant threshold for the consideration of a right-turn lane on the Route 14 westbound approach to the intersection with S. Plymouth Road during the weekday morning peak hour. The Project construction is expected to add approximately 63 additional westbound right-turn movements during the weekday morning peak hour and 4 additional westbound right-turn movements during the weekday evening peak hour.

The proposed Project is not anticipated to materially impact future traffic operations or safety at any of the study area intersections. The right-turn lane warrants listed above are met under existing conditions independent of the proposed Project. In addition, as discussed previously in this report, the available Stopping Sight Distance (SSD) for vehicles approaching the high crash frequencies intersections is well in excess of the required SSD for the posted speed limit. This indicates that drivers approaching the intersection will have more than sufficient view of potential turning traffic at the intersection to either stop or adjust their speed to avoid a collision.

As part of the proposed Project, the Applicant will develop a comprehensive CTMP for each phase of the construction, to alert drivers of potential increased construction traffic and turning activities at key intersections throughout the study area. The Applicant will also work with the general contractor (once selected) to identify truck haul routes to and from the construction laydown areas to avoid sensitive areas and minimize impacts to local agricultural activity along the study area roadways, to the extent possible. In addition, the Applicant will prepare a Traffic Safety Management Plan for the Project-related construction activity in accordance with WSDOT standards. A detailed description of the draft Traffic Safety Plan (TSP) is provided in the subsequent sections of this report.

## 4.0 TRAFFIC OPERATIONS ANALYSIS

In previous sections of this report, the quantity (volume) of traffic on the study area roadways was described. The following section describes the quality of traffic flow on the study area roadways and intersections for the given traffic demands. As a basis for this assessment, road segment and intersection capacity analyses were conducted for the 2023 Existing, 2025 and 2026 No Build (Without Project), 2025 Build (Phase 1 To Laydown Yard 1), 2025 Build (Phase 1 to Laydown Yard 2), and 2026 Build (Phase 2 to Laydown Yard 2) weekday morning and weekday evening peak hour traffic conditions.

The roadway segment analysis has conducted for 10 key roadway segments within the study area using the Highway Capacity Software (HCS 2022) based on the Highway Capacity Manual, 6<sup>th</sup> Edition. The intersection capacity analysis was conducted for the 29 existing intersections and two proposed site driveways serving the laydown yards using for the Build (with Project) conditions Synchro 11 Intersection Capacity and Traffic Simulation Software. The detailed capacity analysis worksheets for the key roadway segments and study area intersections are provided in Appendix H and Appendix I, respectively. A discussion of the evaluation criteria and a summary of the results of the roadway segment and intersection capacity analyses are presented below.

### 4.1 METHODOLOGY

Level-of-service (LOS) is a term used to describe the quality of traffic flow on roadways or at intersections. It is an aggregate measure of travel delay, driver convenience and safety based on a comparison of a roadway facility's capacity relative to the traffic demands. Operating levels of service are reported on a scale of A to F, with A representing the best operating conditions (with little or no vehicle delay) and F representing the worst operating conditions (with long delays). The capacity analyses for roadway segments and unsignalized study intersections were based on the *Highway Capacity Manual (HCM) 6<sup>th</sup> Edition*. The LOS criteria for roadway segments and unsignalized intersections are presented in Table 10.

**Table 10 Intersection Level of Service Criteria**

Level of Service <sup>1</sup>	Average Delay per Vehicle (Seconds)	Density (Veh/lane/mile)
	Unsignalized Intersections	Roadway Segments
A	≤10.0	0-11
B	10.1 to 15.0	11-18
C	15.1 to 25.0	18-26
D	25.1 to 35.0	26-35
E	35.1 to 50.0	35-45
F	>50.0	>45

Source: Transportation Research Board Highway Capacity Manual (HCM) 2000 (signalized)/6<sup>th</sup> Edition (unsignalized)

<sup>1</sup>If the v/c is greater than 1.0, then the level-of-service designation is LOS F, regardless of delays (HCM 6<sup>th</sup> Edition only)

The results of the roadway segment analysis for the weekday morning and weekday afternoon peak hour conditions is presented in Tables 11 and 12, respectively, The results of the unsignalized intersection capacity analysis for the weekday morning and weekday evening peak conditions are presented in Tables

13, and 14 hours, respectively. A brief discussion of the results of the roadway segment and intersection capacity analyses is presented in the following sections of this report.

## **4.2 ROADWAY SEGMENT CAPACITY ANALYSIS RESULTS**

---

As shown in Tables 11 and 12, the roadway segment capacity analysis indicates that all of the study area roadways segments currently operate well below capacity at LOS B or better operations, and will continue operate well below capacity for all phases of the Project construction. All Roadway Segments analyzed are expected to operate at LOS A during all analysis scenarios, except for I-82 (north of Coffin Road). This roadway segment will operate at LOS A in the northbound direction and LOS B in the southbound direction during all analysis scenarios. Based on the detailed analysis, the proposed Project will not result in any capacity constraints at the study area roadways and, ample capacity is available to support peak construction operations associated with the Project.

## 4.3 UNSIGNALIZED INTERSECTION CAPACITY ANALYSIS RESULTS

---

As shown in Tables 13 and 14, the intersection capacity analysis indicate that all of the study area intersections currently operate well below capacity (LOS C or better) and will continue to operate well below capacity for all phases of the Project construction. The proposed Project will result in a maximum increase in delay of approximately two seconds per vehicle, except for Bofer Canyon Road and Locust Grove Road/Route 397. This Intersection is expected to have an increase in delay of approximately 8.1 seconds during the weekday evening peak hour for 2025 Build Phase 1 to Laydown Yard 1 condition. The capacity analysis for the study area intersections indicate that ample capacity is available to support peak construction operations associated with the Project. In addition, the proposed site driveways serving Laydown Yard 1 and Laydown Yard 2 are also expected to operate at LOS B or better for all construction scenarios.

Table 13. Unsignalized Intersection Capacity Analysis Summary – Weekday AM Peak Hour

## 4.4 TRUCK HAUL ROUTES – OVERSIZED LOADS

---

The construction of the proposed wind and solar facility will require large vehicle deliveries for a variety of materials that may include concrete, solar panels, earth materials, building materials, etc. It is anticipated that the majority of construction truck trips to and from the Project site will follow the same general trip distribution patterns described for the workforce Project trips identified earlier in the study.

In addition to the standard sized truck deliveries associated with Project construction, it is anticipated that oversized truck loads will also be needed to deliver wind turbine components and some larger components of the proposed solar arrays. It is anticipated that that all oversized load deliveries would originate to/from the south on Interstate 82 (I-82). Tetra Tech has identified potential truck haul routes between the site parcels and the regional roadway system for these larger oversized delivery vehicles. The potential entering and exiting truck haul routes for the Project oversized load trucks are shown in Figures 30 and 31, respectively.

It is also anticipated that, due to manufacturer constraints, wind turbine tower components will be needed to be delivered and stored on site prior to the construction of the turbines. As currently proposed, the tower transfer yard would be located on the south side of Locus Grove Road, just west of I-82. The specific oversized truck load routes for tower components destined to the tower transfer yard are shown on Figures 32 and 33.

The specific type of oversized vehicle(s) needed to support these additional construction deliveries are highly dependent on the turbine manufacturer and selected transport logistics company. The manufacturer and transport logistics company have not yet been identified. A detailed evaluation of potential truck haul routes for these oversized wind turbine deliveries will be conducted once a manufacturer is chosen.

Additionally, the Applicant commits to preparing a Construction Transportation Management Plan (CTMP) prior to beginning construction to include temporary construction warning signage.

## 5.0 TRAFFIC MITIGATION

---

As discussed in previous sections of this report, the proposed Project is not anticipated to result in capacity constraints at any of the roadway segments and study area intersections evaluated in the study. Tetra Tech has identified safety improvements to be implemented as part of the proposed Project to address existing safety deficiencies and off-set the potential traffic increases associated with the proposed Project.

### 5.1 TRAFFIC SAFETY PLAN

---

The draft Traffic Safety Plan (TSP) will assist in developing the CTMP. The TSP will supply information about the future impacts to the transportation network due to the peak construction of the Project. These impacts are expected to occur within and around the Project boundary during the construction phases of the Project. This document will provide recommendations to enhance traffic safety during construction.

#### 5.1.1 Objectives and Strategies

The objective of traffic safety management plan is:

- To avoid interrupting normal traffic flow. This flow varies depending on the time (rush hours, shift change) and location of the Project entrances (cars, trucks, deliveries).
- For the management of traffic flow allowing Project daily activities to be conducted in a safe manner.
- To protect all road users by defining the type of required traffic safety equipment. The equipment to be used will be, but not limited to, truck route signage, detour route signage, barricades, traffic lights, safety cones, fences, closed road signs.
- To enclose and separate the walking/driving paths on site while construction work is being performed.

The Project has multiple strategies to ensure a smooth traffic flow in and out the Project construction zone. These plans will include the following:

- Ensuring construction tasks will be conducted sequentially to the extent practicable to lessen any impacts as far as schedule or cost.
- Detailed safety Project procedure will be issued with the involvement and approval of both Project and safety management, taking into consideration the entrance to the Project by both equipment and personnel.
- All entry and exit movements to and from traffic streams shall be in accordance with the Project's core process and Environmental Safety and Health Plan (ES&H).
- Design the Project Driveways to include the proper number of traffic lanes and traffic control infrastructure to accommodate the traffic flow and provide safe exit onto the local roadway system.
- To the extent practicable, schedule deliveries to the site to occur during off-peak construction worker commuting times.

All traffic management works, and control devices shall be in accordance with Washington State and Federal Law for construction and improvement of roads. The safety manager and supervisors will work to implement the safety rules on site by keeping a close supervision of all personnel. They will take all reasonable measures to prevent accident or injury during the construction of the plant. All approved procedures and managements practices should be applied and closely implemented.

The final TSP will be finalized in coordination with the Washington State Department of Transportation (WSDOT) and Energy Facility Site Evaluation Council (EFSEC) and will include the following elements to be developed in consideration of local and federal regulations and potential impacts to the surrounding communities:

- Identification of a safety management team responsible for overseeing Project safety. Key personnel will have their roles and responsibilities outlined. The safety management team will routinely conduct safety inspections. Should any safety hazards be identified, the safety management team will implement the appropriate corrective measures in a timely fashion.
- Assessment of potential wind and solar construction site hazards and identification of measures to prevent and mitigate these hazards.
- Develop a training program in coordination with the contractor covering all aspects of safety. All construction staff will be required to undergo safety training prior to working at the Project construction site. Supplemental safety training will be offered throughout the duration of Project construction. The training program will encourage workers to report safety concerns and recommendations as well as promoting a culture of safety and open communication.
- Identification of required personal protective equipment (PPE) for wind and solar construction activities. Protocols for the proper use, maintenance and replacement of PPE will be established prior to construction.

- Development of an Emergency Response Plan (ERP) establishing protocols for evacuations, medical emergencies as well as fire and severe weather incidents occurring in the vicinity of the Project construction sites.
- Development of incident reporting and investigation protocol for reporting and documenting safety hazards.

### 5.1.2 Construction Traffic Management Plan

A CTMP will be developed in consultation with the WSDOT and Benton County public works staff, as appropriate, prior to construction. The CTMP will follow WSDOT Design Manual 22-01.21 Chapter 1010. A CTMP is a key element in addressing known work zone safety and mobility impacts.

The CTMP may include Temporary Traffic Control (TTC) Components such as:

- Lane closures or lane shifts
- Traffic Control devices
- Pavement markings
- Changeable message signs
- Temporary signals

Transportation Systems Management and Operations (TSMO) is the second component to a TMS. Key TSMO components may include Work Zone Safety Management strategies such as:

- Positive protective devices
- Speed limit reductions
- Automated flagger assistance devices
- Radar speed display signs

The final element of a CTMP to be considered are Public Information and Awareness Strategies, which may include, but are not limited to, the following strategies:

- Public Awareness Strategies such as Brochures or mailers, press releases, paid advertisements, and Project website (consider providing information in other languages if appropriate).
- Motorist Information Strategies such as Highway advisory radio (HAR), changeable message signs, and transportation management center (TMC).

## 5.2 TRANSPORTATION DEMAND MANAGEMENT (TDM) PROGRAM

---

The Applicant also commits to implementing a Transportation Demand Management (TDM) program to reduce automobile travel and traffic impacts associated with the Project construction. Potential TDM measures include the following:

- Encourage carpooling among the construction workforce
- Provide a transportation coordinator who can match workers for carpooling
- Explore the feasibility of providing shuttle bus service between the proposed laydown areas and the construction sites
- Explore the feasibility of coordinating a Vanpool service from select locations within the Tri-Cities area.

## 6.0 CONCLUSIONS

Tetra Tech has evaluated the potential traffic impacts associated with the temporary increase in traffic associated with peak construction operations for the Project at 29 existing study area intersections and the proposed site driveways at the two laydown areas. The analysis indicates that ample capacity is available within the study area to support the peak construction workforce levels associated with the Project with all intersections operating well below capacity at LOS C or better operations.

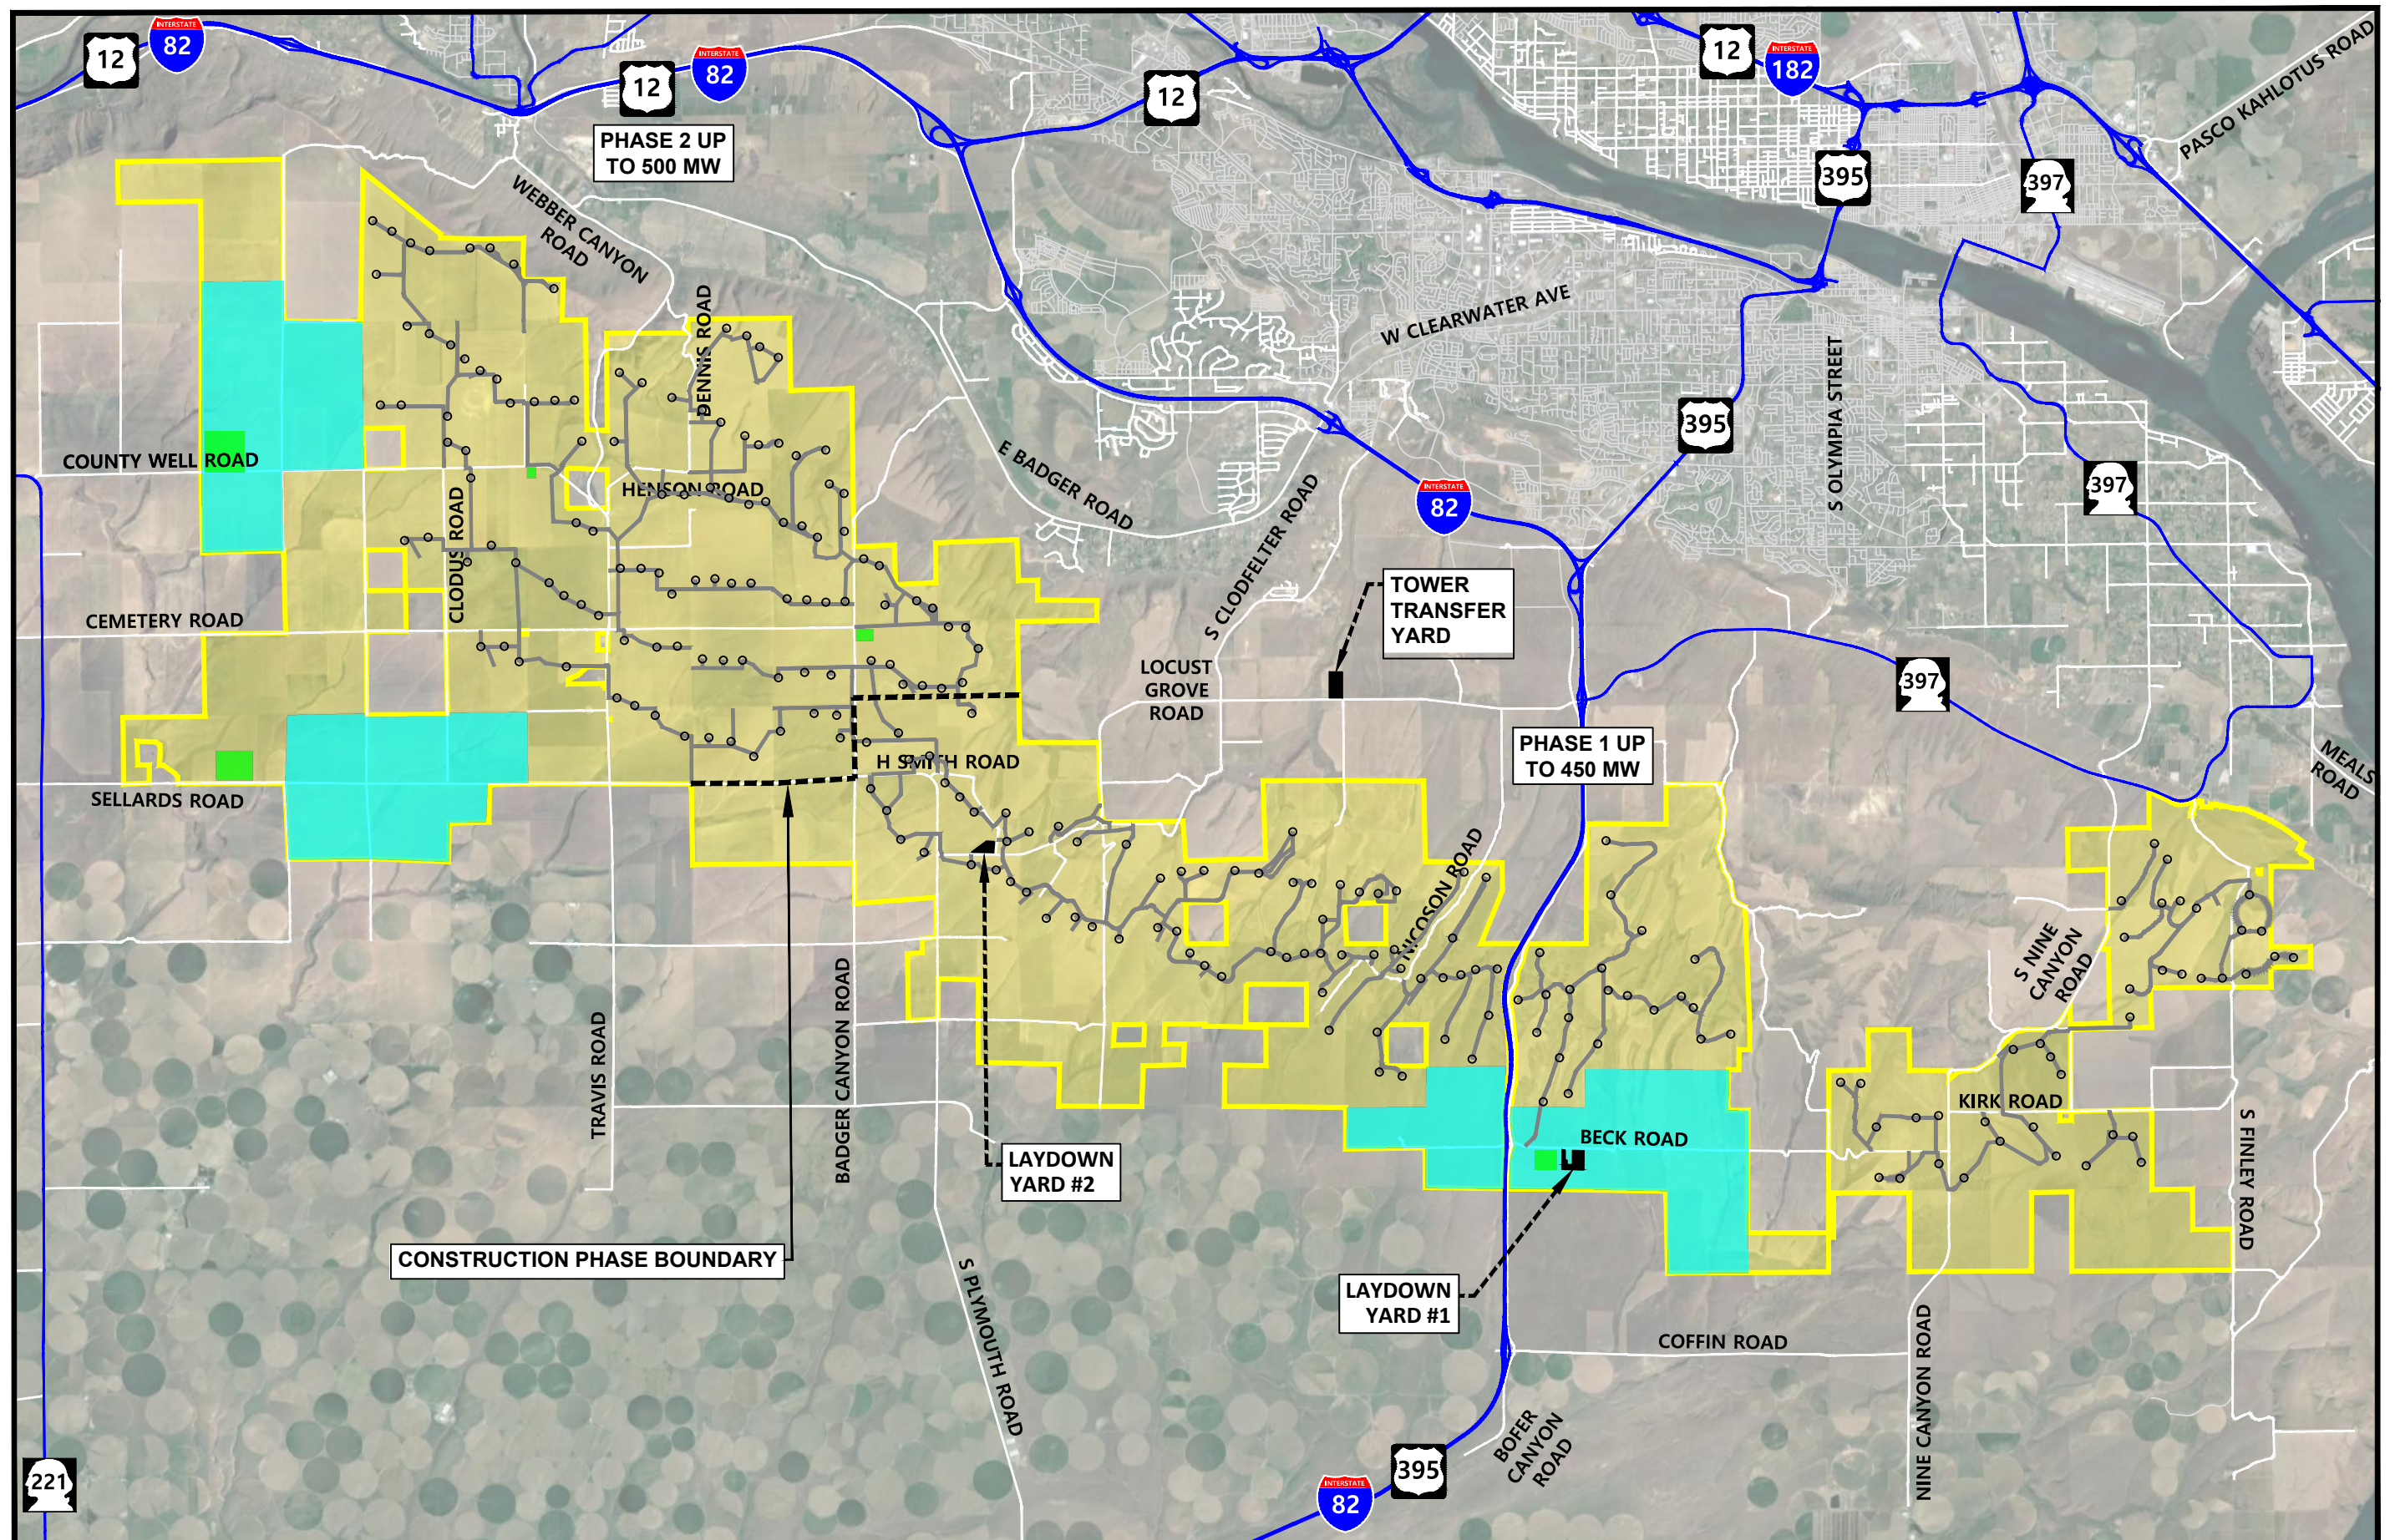

The safety analysis conducted as part of this study indicates that four of the existing study intersections would benefit from potential safety mitigation measures to address existing safety deficiencies. An auxiliary lane warrant analysis indicates that two of the study intersections (Route 14 at S. Plymouth Road and Route 221 at Route 14) currently meet the traffic volume threshold for implementation of separate right-turn lanes under existing traffic volume conditions (independent of the Project construction activity). However, the intersection capacity analysis indicates that these intersections will continue to operate well below capacity during all phases of the Project construction. In addition, the available sight distance at the high crash rate intersections is well above the required Stopping Sight Distance (SSD), indicating that motorists approaching these locations will have more than sufficient view of the potential turning movements at the intersections to stop or adjust their travel speeds as needed to avoid a potential collision.

Given the temporary nature of the of the potential traffic increases associated with Project construction, no additional turns are recommended at these intersections by the Applicant as part of the proposed Project at this time. However, the Applicant is committed to developing a comprehensive Construction Traffic Management Plan (CTMP), for each phase of the construction, to alert drivers of potential increased construction traffic and turning activities at key intersections throughout the study area. The Applicant will also work with the general contractor (once selected) to identify truck haul routes to and from the construction laydown areas avoid sensitive areas and minimize impacts to local agricultural activity along the study area roadways, to the extent possible. In addition, the Applicant will prepare a Traffic Safety Plan for the Project-related construction activity in accordance with the Washington State Department of Transportation (WSDOT) standards.

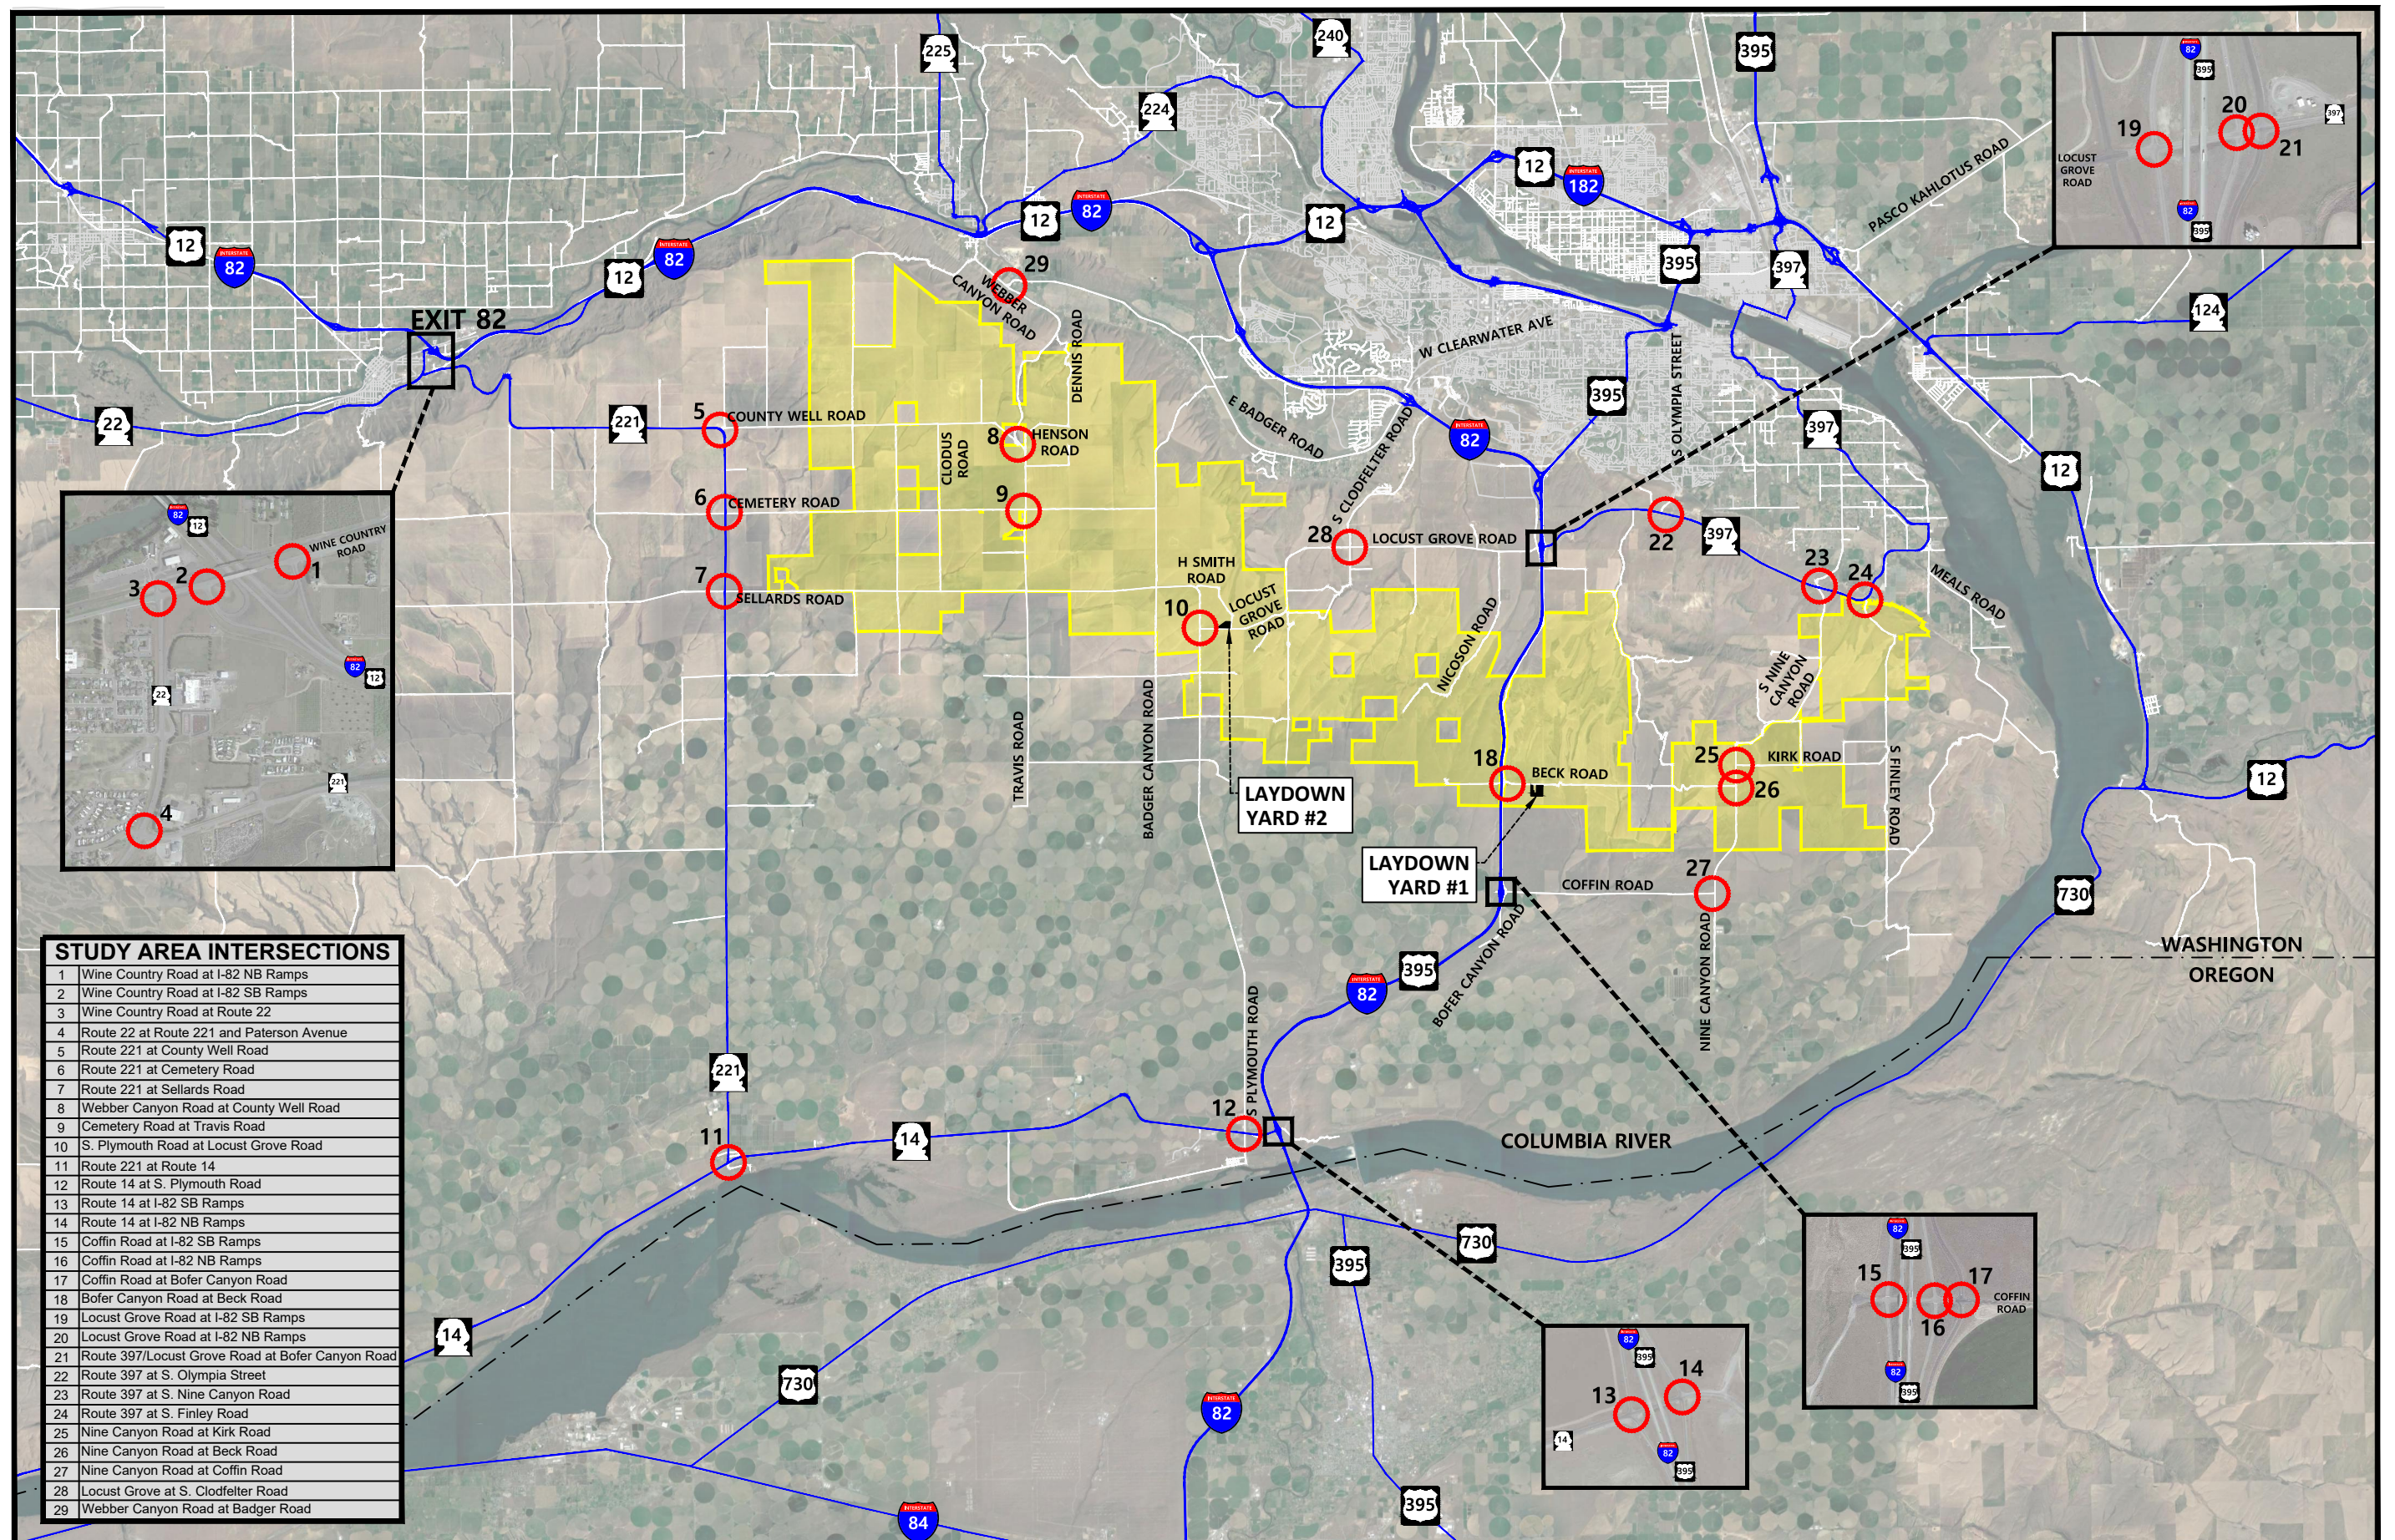

The Applicant will also work with the contractor to develop a Travel Demand Management (TDM) program to minimize reliance on single-occupant vehicles and reduce single occupancy vehicle trips to and from the site.

RE: Traffic Scoping Letter  
Horse Heaven Wind Farm  
EFSEC Docket Number: EF-210011  
Benton County, WA

Dear Ms. Moon,

Tetra Tech has prepared this Transportation Scoping Letter (TSL) to provide the Washington State Energy Facility Site Evaluation Council (EFSEC) and Washington State Department of Transportation (WSDOT) with the basic scope of analysis, technical assumptions, and key transportation issues to be addressed in the Traffic Impact Analysis (TIA) to be prepared for the Horse Heaven Wind Farm project (the Project). The TIA will be prepared in accordance with WSDOT TIA guidelines. Preliminary transportation assessments were previously included in the December 2022 Draft Environmental Impact Statement (DEIS) and February 2021 (as revised December 2022) Updated Application for Site Certification (ASC) for the Project.

Pending EFSEC approval of the ASC at its earliest opportunity, given recent delays, the Applicant now anticipates beginning construction of the first phase of the Project in late 2024 or early 2025 with commercial operation approximately 11 months following start of construction. A second phase of the Project would begin construction in 2025 and begin operation in 2026. The construction schedule would be revised according to the actual approval of the Site Certification Agreement and implementation of commercial agreements for power purchase, and a copy provided to EFSEC at least sixty (60) days prior to the start of construction.

The TSL provides a brief discussion of key elements of the transportation analysis for the Project including:

- Project Description
- Planned Roadway Improvements
- Transportation Demand Management
- Project Construction Trip Generation
- Project Trip Distribution Patterns
- Study Area and Transportation Network
- Analysis Periods
- Traffic Safety
- Truck Haul Route Evaluation
- Traffic Mitigation

Tetra Tech is seeking EFSEC's and WSDOT's concurrence on the proposed study methodology so that we can proceed with preparation of the TIA.

## **Project Description**

Horse Heaven Wind Farm, LLC (Applicant) is proposing to construct and operate the Project in unincorporated Benton County, Washington, within the Horse Heaven Hills area. The Project would consist of a renewable energy generation facility that would have a maximum grid injection capacity of up to 1,150 megawatts for a combination of wind and solar facilities, battery energy storage systems (BESS), and other Project components, including underground and overhead electrical collection lines, underground communication lines, new Project substations, access roads, operations and maintenance facilities, and meteorological towers.

At its closest point, the Project would be located approximately 4 miles south/southwest of the City of Kennewick and the larger Tri-Cities urban area, along the Columbia River. Figure 1 shows the current Project Lease Boundary and Project vicinity. The Project's Lease Boundary (approximately 72,428 acres) incorporates all of the parcels for which the Applicant has executed a lease to construct the turbines, solar arrays, and associated facilities. The Project's Wind Energy Micrositing Corridor encompasses 11,850 acres within the Lease Boundary and consists of the areas where the turbines and supporting facilities would be sited during the final design. The Applicant seeks authorization for up to 244 turbine locations and a maximum of three solar arrays, with all possible turbine locations and solar arrays cumulatively reviewed to analyze potential resource impacts.

There are two options for the wind turbines (Option 1 and Option 2). The final number and location of turbines within the proposed Wind Energy Micrositing Corridor would reflect the final engineering design, model selection, and any additional avoidance and mitigation identified in the Final EIS. The specific model used would depend on the commercial availability and technology at the time of construction. The number of turbines would not exceed 244, and the maximum turbine height (at blade tip) would not exceed 671 feet. The DEIS assumed that the road disturbance associated with Turbine Option 1 and Turbine Option 2 would be identical.

As currently proposed, the Project would be built in two construction phases (Phase 1 and Phase 2). Phase 1 construction could generate power via wind and solar. Phase 1 could also include a BESS capable of storing energy. Phase 2 construction has two alternatives (Phase 2a and Phase 2b). Phase 2a could consist of the construction of both wind and solar facilities. The Applicant's Phase 2a scenario also includes the construction of a BESS. Phase 2b could increase power generation via the construction of additional wind turbines, but construction would not include a BESS.

During peak construction of each phase, a typical day would include the transportation of workers, materials, and movement of heavy equipment. Numerous on-site roadways are proposed to support the Project as well as one laydown area per construction phase as shown in Figure 1. The laydown areas would facilitate the delivery and assembly of materials and equipment. They would also serve as parking areas for the construction workforce.

## **Planned Roadway Improvements**

As part of the TIA preparation, Tetra Tech will coordinate with WSDOT and Benton County to identify roadway improvements planned to be implemented by Others prior to the Project construction at study area roadways and intersections. If the construction of any roadway improvement projects planned by Others are anticipated to overlap with the proposed Project construction, Tetra Tech will coordinate closely with WSDOT and Benton County staff to implement additional construction management strategies and traffic mitigation, where appropriate, to ensure that cumulative construction impacts are minimized.

## **Transportation Demand Management**

There are currently no public transportation services in the vicinity of the proposed laydown areas. However, the Applicant commits to encouraging carpooling among the Project's construction workforce to reduce single

occupancy vehicle trips to and from the site. Additionally, the Applicant will explore the feasibility of other potential transportation demand management (TDM) measures as part of the TIA.

### **Project Construction Trip Generation**

The Project will consist of three stages: construction, O&M, and decommissioning. The highest volume of site-related trips will occur during the peak construction phase of the Project. Therefore, the TIA will be based on the vehicle trip generation associated with the peak construction phase workforce levels.

Preliminary vehicle trip generation estimates were included in the Project's ASC. These estimates were further refined as part of this TSL to inform the study area and be used as the basis for analysis in the TIA. Construction of the proposed energy facility is expected to include grading, panel installation, inspections, and equipment deliveries. It is anticipated that, at peak operations, the site could experience construction workforce levels of up to 467 construction workers at one time. Construction hours of operation are assumed to generally be 7:00 AM to 7:00 PM with the majority of construction workers arriving prior to 7:00 AM and departing after 7:00 PM. Since the peak hours of the adjacent street traffic are expected to occur sometime during the peak commuting periods of 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM, it is expected that the majority of construction workers would arrive and depart the site outside of the typical weekday morning and weekday evening commuter peak hours of the adjacent streets. However, to present a conservative assessment of potential traffic increases associated with the Project, it is assumed the TIA will assume they arrive to the laydown sites and park, then drive to the specific worksites, then return to the laydown sites at the end of the day and that all of the construction workers would arrive during the weekday morning peak hour and depart during the weekday evening peak hour. Additionally, peak construction activities are currently anticipated to occur for only a portion of each the two successive 11-month periods. The remainder of the construction periods is anticipated to generate fewer vehicle trips. The supporting trip generation calculations and assumptions for the proposed Project's peak construction workforce levels are provided in the Attachments.

There are no public transportation services in the vicinity of the Project site that are anticipated to be used for the Project. Therefore, for the purposes of this assessment, it was assumed that no construction workers would use public transit to access the site. Additionally, it is anticipated that some construction workers would arrive and depart the site together (carpooling). For purposes of this assessment, it was assumed that the average vehicle would have 1.25 occupants to represent carpooling to/from the site.

There are currently two alternatives being considered for Phase 2 of the Project construction. Table 1 presents a summary of the trip generation estimates for the proposed Project's peak construction workforce activities by phase. The more conservative trip generation of the two Phase 2 alternatives (Phase 2a) will be used for the TIA analyses.

**Table 1 Construction Trip Generation Summary<sup>1</sup>**

- 1) Based on the Horse Heaven Wind Farm Updated ASC (December 2022).
- 2) Used ASC estimated maximum Phase 1 peak period worker vehicle trips of 374. Weekday daily workforce traffic volumes account for all workers travelling within the site from the laydown yard to the worksite and back before heading home.
- 3) Used ASC estimated maximum Phase 1 250 truck trips per day. Used ASC assumption of 5% of daily truck trips occur during the peak hours.
- 4) Used ASC estimated maximum Phase 2a peak period worker vehicle trips of 344. Weekday daily workforce traffic volumes account for all workers travelling within the site from the laydown yard to the worksite and back before heading home.
- 5) Used ASC estimated maximum Phase 2a 200 truck trips per day. Used ASC assumption of 5% of daily truck trips occur during the peak hours.
- 6) Used ASC estimated maximum Phase 2b peak period worker vehicle trips of 330. Weekday daily workforce traffic volumes account for all workers travelling within the site from the laydown yard to the worksite and back before heading home.
- 7) Used ASC estimated maximum Phase 2b 206 truck trips per day. Used ASC assumption of 5% of daily truck trips occur during the peak hours.

## **Project Trip Distribution Patterns**

Tetra Tech has developed separate Project trip distribution patterns for the Project's peak construction activities at the two proposed laydown areas. The trip distribution patterns were developed based on consideration of the effective population within the anticipated employment workforce (approximate 2-hour drivetime zone) and the currently proposed location of the laydown area for each phase. The Project construction workforce trip distribution patterns are shown in Figures 2 and 3, respectively.

## **Study Area Intersections**

A comprehensive group of intersections have been chosen for detailed analysis in the TIA to be prepared for the Project. These study area intersections are shown in Figure 1 and include the 29 existing locations listed below. These are the intersections that have the potential be materially impacted by the Project. The TIA will also include an analysis of the proposed laydown site driveways where they intersect the public roadway system.

- Wine Country Road at I-82 NB Ramps
- Wine Country Road at I-82 SB Ramps
- Wine Country Road at Route 22
- Route 22 at Route 221 and Paterson Avenue
- Route 221 at County Well Road
- Route 221 at Cemetery Road
- Route 221 at Sellards Road
- Webber Canyon road at County Well Road
- Cemetery Road at Travis Road
- S. Plymouth Road at S. Clodfelter Road
- Route 221 at Route 14
- Route 14 at S. Plymouth Road
- Route 14 at I-82 SB Ramps
- Route 14 at I-82 NB Ramps
- Coffin Road at I-82 SB Ramps
- Coffin Road at I-82 NB Ramps
- Coffin Road at Bofer Canyon Road
- Bofer Canyon Road at Beck Road
- Locust Grove Road at I-82 SB Ramps
- Locust Grove Road at I-82 NB Ramps
- Route 397/Locust Grove Road at Bofer Canyon Road
- Route 397 at S. Owens Road
- Route 397 at S. Nine Canyon Road
- Route 397 at S. Finley Road
- Nine Canyon Road at Kirk Road
- Nine Canyon Road at Beck Road
- Nine Canyon Road at Coffin Road
- Locust Grove Road at S. Clodfelter Road
- Webber Canyon Road at Badger Road

## Analysis Periods

The TIA will be prepared based on WSDOT guidelines and provide a detailed analysis of the 2023 Existing, 2025 No Build (Without Project), 2025 Phase 1 Build (With Phase 1 Peak Construction) and 2026 Phase 2 Build (With Phase 2 Peak Construction) traffic operations at the study intersections for the weekday morning and weekday evening peak hours, when the combination of Project construction traffic and existing traffic already traveling on the adjacent area roadways would be greatest. As described under Project Description, Phases 1 and 2 of Project construction are anticipated to occur in successive 11-month periods, with Phase 1 beginning in late 2024/early 2025. As a conservative measure, the future year chosen for analysis in the TIA will be the design year 2025 for Phase 1 and the year 2026 for Phase 2.

The 2023 existing traffic volumes will be developed based on intersection Turning Movement Counts (TMCs) to be collected at the study area intersections. Construction hours of operation are anticipated to generally occur from 7:00 AM to 7:00 PM. Therefore, the TMCs will be collected at the study area intersections on a typical weekday (Tuesday, Wednesday, or Thursday) from 6:00 AM to 9:00 AM and 4:00 PM to 8:00 PM to establish the weekday morning and evening commuter peak hour conditions. Any necessary seasonal adjustment factors to be applied to the observed traffic volumes will be identified in consultation with WSDOT.

Analysis of roadway segments will also be included in the TIA for the following three key locations. Permanent count station data from WSDOT will be used for locations 1 and 2. New Automatic Traffic Recorder (ATR) counts will be collected for a 24-hour weekday period at Locations 2 and 4 through 10.

1. I- 82 (North of Coffin Road)
2. Route 397 (West of Nine Canyon Road)
3. Route 221 (South of Sellards Road)
4. Bofer Canyon Road (north of Coffin Road)
5. Nine Canyon Road (south of Route 397)
6. Locust Grove Road (between Nicosin Road and I-82)
7. Travis Road (north of Sellards Road)
8. Plymouth Road (north of Route 14)
9. Sellards Road (between Route 221 and Tyack Road)
10. Badger Canyon Road (north of Sellards Road)

The future year (2025) baseline peak hour volumes will be forecasted using a general background growth rate to be identified in consultation with WSDOT staff. The general background growth rate will be applied to the 2023 existing traffic volumes to develop the future 2025 Baseline peak hour traffic volumes. Additionally, Tetra Tech will coordinate with WSDOT and Benton County planning staff to identify any specific background development projects to include in the future year forecasts. Only projects anticipated to be built and occupied by 2025 will be included in the development of future year traffic volumes. The Phase 1 and Phase 2 project trips will then be added to the 2025 No Build (Without Project) peak hour traffic volumes to estimate the 2025 Phase 1 Build (Peak Construction) and 2026 Phase 2 Build (Peak Construction) peak hour traffic volumes.

Capacity analyses of the study area intersections will be conducted using Synchro Version 11 software for the 2023 Existing, 2025 No Build, 2025 Phase 1 Build (Peak Construction) and 2026 Phase 2 Build (Peak Construction) weekday morning and weekday evening peak hours.

## **Traffic Safety Evaluation**

As part of the TIA, Tetra Tech will submit a Request for Crash Data form to WSDOT to obtain crash data for the study area roadways and intersections for the most recent 5-year period available. Highway Safety Manual (HSM) predictive methods will be used to analyze safety at each of the study area intersections in accordance with WSDOT guidelines using Transportation Research Board (TRB) spreadsheets and/or the Federal Highway Administration (FHWA) IHSDM software.

Stopping sight distance (SSD) and intersection sight distance (ISD) analyses will be conducted at the proposed laydown area site driveways where they intersect the public roadway system. The sight distance analyses will be performed in accordance with WSDOT and American Association of State Highway Transportation Officials (AASHTO) guidelines.

A Draft Safety Management Plan will also be prepared for the Project-related construction activity separate from the TIA in accordance with WSDOT standards.

## **Truck Haul Route Evaluation**

The ASC included a preliminary truck haul assessment prepared by TLG Transport Inc. The preliminary truck haul routes identified in the DEIS and Updated ASC for Phase 1 and Phase 2 of Project construction are shown in Figures 4 through 7. The truck haul routes will continue to be evaluated as part of the TIA and the estimated truck trips summarized in Table 1 will be assigned to the study area roadway network based on the final truck routes.

## **Traffic Mitigation**

Traffic mitigation needed to support peak construction activities associated with the Project will be recommended in the TIA. Mitigation will be identified for any study area intersection or roadway segment determined to exceed LOS C operations for rural facilities and LOS D for urban non-NHS facilities and/or locations identified in the TIA to have safety deficiencies that may be enhanced with geometric, traffic control or signage improvements. Traffic mitigation will also be proposed at locations where existing geometry does not currently support the largest vehicles anticipated to be used during construction of the Project. The 2020 WSDOT State Highway Log will be used to determine urban or rural status for study area roadways.

Traffic mitigation will be designed in accordance with WSDOT and Benton County standards. The Applicant indicates in a signed franchise agreement with Benton County Public Works, dated July 2, 2019, that all work done on existing Benton County roads will be done in accordance with Benton County requirements and with review and approval by the County Engineer. Preliminary findings and traffic mitigation recommendations will be reviewed with WSDOT prior to the finalization of the TIA.

We respectfully request concurrence from EFSEC and WSODT on the proposed study area and methodologies discussed above. Please do not hesitate to contact Robert Woodland with any questions or concerns at (781) 910-7015 or Kristen Daniel at (509) 372-5819.

Sincerely,

Kristen Daniel, PE

Notes:

- 1) Based on peak period turning movement count data collected on June 13th, 2023 & June 14th, 2023.
- 2) PM Peak Hour K Factor was calculated using ATR Data collected throughout the study area.
- 3) Crash Data provided by WSDOT.
- 4) Crash Rate calculated per million entering vehicles.

# PROJECT SAFETY PERFORMANCE SUMMARY REPORT

## General Information

Project Name: Horse Heaven Wind Farm  
 Project Description: Safety Analysis  
 Reference Number: 143-67639-23007  
 Analyst: James Vorosmarti  
 Agency/Company: WSDOT  
 Contact Email: james.vorosmarti@tetrattech.com  
 Contact Phone: 508-786-2235  
 Date Completed: 07/17/23

Years of crash data incorporated into the analysis: 5

## PROJECT SUMMARY

### Summary of Anticipated Safety Performance of the Project (average crashes/year)

Project Element	Total Crashes/yr (KABCO)			Fatal and Injury Crashes/yr (KABC)			Property Damage Only Crashes/yr (PDO)		
	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement
	N <sub>predicted</sub> (KABCO)	N <sub>expected</sub> (KABCO)		N <sub>predicted</sub> (KABC)	N <sub>expected</sub> (KABC)		N <sub>predicted</sub> (O)	N <sub>expected</sub> (O)	
<b>INDIVIDUAL INTERSECTIONS</b>									
Intersection 1	1.0	0.7	0.0	0.4	0.3	0.0	0.6	0.4	0.0
Intersection 2	1.0	1.0	0.0	0.4	0.4	0.0	0.6	0.6	0.0

## PROJECT SUMMARY -- Site-Specific EB Method Summary Results for Rural 2-Lane Roads

Crash severity level	N <sub>predicted</sub> (PROJECT)	N <sub>expected</sub> (PROJECT)	N <sub>potential for improvement</sub> (PROJECT)
	Predicted average crash frequency - Average safety performance of projects consisting of similar elements (anticipated average crashes/yr)	Expected average crash frequency - Actual long-term safety performance of the project (anticipated average crashes/yr)	Potential for Safety Improvement (anticipated average crashes/yr)
Fatal and injury (KABC)	9.9	7.5	N/A
Property damage only (PDO)	13.2	10.1	N/A
Total (KABCO)	23.1	17.6	N/A

HSM1 Extended Spreadsheet for Part C Chapter 10 v.9.1

**Worksheet 2A -- General Information and Input Data for Rural Two-Lane Two-Way Roadway Intersections**

General Information				Location Information			
Analyst	James Vorosmarti			Roadway	0		
Agency or Company	WSDOT			Intersection	Wine Country Road at I-82 NB Ramps		
Date Performed	07/17/23			Jurisdiction	WSDOT		
Intersection	Intersection 1			Analysis Year	2023		
Signalized/Unsignalized	Unsignalized						
<b>Input Data</b>				<b>Site Conditions</b>		<b>Base Conditions</b>	
Intersection type (3ST, 4ST, 4SG)				3ST		--	
AADT <sub>major</sub> (veh/day)		AADT <sub>MAX</sub> = 19,500 (veh/day)		5,270		--	
AADT <sub>minor</sub> (veh/day)		AADT <sub>MAX</sub> = 4,300 (veh/day)		2,440		--	
Intersection skew angle (degrees) [If 4ST, does skew differ for minor legs? Else, No.]			No	Skew for Leg 1 (All):	0	Skew for Leg 2 (4ST only):	0
Number of signalized or uncontrolled approaches with a left-turn lane (0, 1, 2, 3, 4)				1		0	
Number of signalized or uncontrolled approaches with a right-turn lane (0, 1, 2, 3, 4)				0		0	
Intersection lighting (present/not present)				Present		Not Present	
Calibration Factor, C <sub>i</sub>				1.00		1.00	
<b>Average Annual Crash History (3 or 5-yr average)</b>							
Intersection crashes				KABC	Fatal and Injury Only		0.2
				PDO	Property Damage Only		0.4

NOTES: \* AADT: It is important to remember that the AADT(major) = AADT(major approach1) + AADT(minor approach2) (refer to p.10-6 in Part C of the HSM)

PROJECT ELEMENT RESULTS SUMMARY <sup>1</sup>									
Summary for the project element	Total Crashes/yr (KABCO)			Fatal and Injury Crashes/yr (KABC)			Property Damage Only Crashes/yr (PDO)		
	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement
	N <sub>predicted</sub> (KABCO)	N <sub>expected</sub> (KABCO)		N <sub>predicted</sub> (KABC)	N <sub>expected</sub> (KABC)		N <sub>predicted</sub> (O)	N <sub>expected</sub> (O)	
	1.0	0.7	0.0	0.4	0.3	0.0	0.6	0.4	0.0

Special Note: When the project element is not included in the analysis the results will all be zeros. In addition if only the analysis only includes determining the predicted average crash frequency (i.e. EB analysis is not carried out), the results will show zero values where EB results are usually displayed.

<sup>1</sup> The values in this table are rounded values. For unrounded values, refer to Worksheet 1L.

PROJECT ELEMENT RESULTS SUMMARY <sup>1</sup>									
Summary for the project element	Total Crashes/yr (KABCO)			Fatal and Injury Crashes/yr (KABC)			Property Damage Only Crashes/yr (PDO)		
	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement
	N <sub>predicted</sub> (KABCO)	N <sub>expected</sub> (KABCO)		N <sub>predicted</sub> (KABC)	N <sub>expected</sub> (KABC)		N <sub>predicted</sub> (O)	N <sub>expected</sub> (O)	
	1.3	2.0	0.6	0.6	0.9	0.3	0.8	1.1	0.4

Special Note: When the project element is not included in the analysis the results will all be zeros. In addition if only the analysis only includes determining the predicted average crash frequency (i.e. EB analysis is not carried out), the results will show zero values where EB results are usually displayed.

<sup>1</sup> The values in this table are rounded values. For unrounded values, refer to Worksheet 1L.

**Worksheet 2A -- General Information and Input Data for Rural Two-Lane Two-Way Roadway Intersections**

# PROJECT SAFETY PERFORMANCE SUMMARY REPORT

## General Information

Project Name: Horse Heaven Wind Farm  
 Project Description: Safety Analysis (Lighting Mitigation)  
 Reference Number: 143-67639-23007  
 Analyst: Linde Thatcher  
 Agency/Company: WSDOT  
 Contact Email: linde.thatcher@tetrattech.com  
 Contact Phone: 508-786-2222  
 Date Completed: 07/21/23

Years of crash data incorporated into the analysis: 5

## PROJECT SUMMARY

### Summary of Anticipated Safety Performance of the Project (average crashes/year)

Project Element	Total Crashes/yr (KABCO)			Fatal and Injury Crashes/yr (KABC)			Property Damage Only Crashes/yr (PDO)		
	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement
	N <sub>predicted</sub> (KABCO)	N <sub>expected</sub> (KABCO)		N <sub>predicted</sub> (KABC)	N <sub>expected</sub> (KABC)		N <sub>predicted</sub> (O)	N <sub>expected</sub> (O)	
<b>INDIVIDUAL INTERSECTIONS</b>									
Intersection 1	1.3	2.0	0.6	0.6	0.9	0.3	0.8	1.1	0.4
Intersection 2	2.0	2.0	0.0	0.8	0.9	0.0	1.1	1.1	0.0
Intersection 3	2.5	2.1	0.0	1.1	0.9	0.0	1.4	1.2	0.0
Intersection 4	0.4	0.7	0.3	0.2	0.3	0.1	0.3	0.4	0.2
<b>COMBINED (sum of column)</b>	<b>6.2</b>	<b>6.9</b>	<b>0.6</b>	<b>2.7</b>	<b>2.9</b>	<b>0.3</b>	<b>3.6</b>	<b>3.9</b>	<b>0.4</b>

### PROJECT SUMMARY -- Site-Specific EB Method Summary Results for Rural 2-Lane Roads

Crash severity level	N <sub>predicted</sub> (PROJECT)	N <sub>expected</sub> (PROJECT)	N <sub>potential for improvement</sub> (PROJECT)
	Predicted average crash frequency - Average safety performance of projects consisting of similar elements (anticipated average crashes/yr)	Expected average crash frequency - Actual long-term safety performance of the project (anticipated average crashes/yr)	Potential for Safety Improvement (anticipated average crashes/yr)
Fatal and injury (KABC)	2.7	2.9	0.3
Property damage only (PDO)	3.6	3.9	0.4
Total (KABCO)	6.2	6.9	0.6

HSM1 Extended Spreadsheet for Part C Chapter 10 v.9.1

## Discussion of Results

Given the potential effects of project characteristics on safety performance, results indicate that:

- It is anticipated that the project will, on average, experience 6.9 crashes per year (2.9 fatal and injury crashes per year; and 3.9 property damage only crashes per year).
- A similar project is anticipated, on average, to experience 6.2 crashes per year (2.7 fatal and injury crashes per year; and 3.6 property damage only crashes per year).
- It is anticipated the project has, on average, a potential for safety improvement of 0.6 crashes per year (0.3 fatal and injury crashes per year; and 0.4 property damage only crashes per year).

Date Completed  
07/21/23

Years of crash data incorporated into the analysis: 5

## PROJECT SUMMARY

### Summary of Anticipated Safety Performance of the Project (average crashes/year)

Project Element	Total Crashes/yr (KABCO)			Fatal and Injury Crashes/yr (KABC)			Property Damage Only Crashes/yr (PDO)		
	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement
	N <sub>predicted</sub> (KABCO)	N <sub>expected</sub> (KABCO)		N <sub>predicted</sub> (KABC)	N <sub>expected</sub> (KABC)		N <sub>predicted</sub> (O)	N <sub>expected</sub> (O)	
<b>INDIVIDUAL INTERSECTIONS</b>									
Intersection 1	1.1	1.8	0.7	0.5	0.8	0.3	0.6	1.0	0.4
Intersection 2	1.5	1.8	0.3	0.6	0.8	0.1	0.8	1.0	0.2
Intersection 3	1.0	1.5	0.6	0.4	0.7	0.2	0.5	0.9	0.3
Intersection 4	0.4	0.7	0.3	0.2	0.3	0.1	0.2	0.4	0.2
<b>COMBINED (sum of column)</b>	3.9	5.9	2.0	1.7	2.5	0.8	2.2	3.4	1.1

### PROJECT SUMMARY -- Site-Specific EB Method Summary Results for Rural 2-Lane Roads

Crash severity level	N <sub>predicted</sub> (PROJECT)	N <sub>expected</sub> (PROJECT)	N <sub>potential for improvement</sub> (PROJECT)
	Predicted average crash frequency - Average safety performance of projects consisting of similar elements (anticipated average crashes/yr)	Expected average crash frequency - Actual long-term safety performance of the project (anticipated average crashes/yr)	Potential for Safety Improvement (anticipated average crashes/yr)
Fatal and injury (KABC)	1.7	2.5	0.8
Property damage only (PDO)	2.2	3.4	1.1
Total (KABCO)	3.9	5.9	2.0

HSM1 Extended Spreadsheet for Part C Chapter 10 v.9.1

## Discussion of Results

Given the potential effects of project characteristics on safety performance, results indicate that:

- It is anticipated that the project will, on average, experience 5.9 crashes per year (2.5 fatal and injury crashes per year; and 3.4 property damage only crashes per year).
- A similar project is anticipated, on average, to experience 3.9 crashes per year (1.7 fatal and injury crashes per year; and 2.2 property damage only crashes per year).
- It is anticipated the project has, on average, a potential for safety improvement of 2 crashes per year (0.8 fatal and injury crashes per year; and 1.1 property damage only crashes per year).

# PROJECT SAFETY PERFORMANCE SUMMARY REPORT

## General Information

Project Name: Horse Heaven Wind Farm  
 Project Description: Safety Analysis (Left Turn Mitigation)  
 Reference Number: 143-67639-23007  
 Analyst: Linde Thatcher  
 Agency/Company: WSDOT  
 Contact Email: linde.thatcher@tetrattech.com  
 Contact Phone: 508-786-2222  
 Date Completed: 07/21/23

Years of crash data incorporated into the analysis: 5

## PROJECT SUMMARY

### Summary of Anticipated Safety Performance of the Project (average crashes/year)

Project Element	Total Crashes/yr (KABCO)			Fatal and Injury Crashes/yr (KABC)			Property Damage Only Crashes/yr (PDO)		
	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement
	N <sub>predicted</sub> (KABCO)	N <sub>expected</sub> (KABCO)		N <sub>predicted</sub> (KABC)	N <sub>expected</sub> (KABC)		N <sub>predicted</sub> (O)	N <sub>expected</sub> (O)	
<b>INDIVIDUAL INTERSECTIONS</b>									
Intersection 1	0.8	1.6	0.8	0.3	0.7	0.3	0.4	0.9	0.4
Intersection 2	0.9	1.5	0.6	0.4	0.6	0.2	0.5	0.8	0.3
Intersection 3	1.3	1.7	0.4	0.6	0.7	0.2	0.7	1.0	0.2
Intersection 4	0.3	0.6	0.3	0.1	0.2	0.1	0.2	0.3	0.2
<b>COMBINED (sum of column)</b>	<b>3.2</b>	<b>5.3</b>	<b>2.1</b>	<b>1.4</b>	<b>2.3</b>	<b>0.9</b>	<b>1.8</b>	<b>3.0</b>	<b>1.2</b>

### PROJECT SUMMARY -- Site-Specific EB Method Summary Results for Rural 2-Lane Roads

Crash severity level	N <sub>predicted</sub> (PROJECT)	N <sub>expected</sub> (PROJECT)	N <sub>potential for improvement</sub> (PROJECT)
	Predicted average crash frequency - Average safety performance of projects consisting of similar elements (anticipated average crashes/yr)	Expected average crash frequency - Actual long-term safety performance of the project (anticipated average crashes/yr)	Potential for Safety Improvement (anticipated average crashes/yr)
Fatal and injury (KABC)	1.4	2.3	0.9
Property damage only (PDO)	1.8	3.0	1.2
Total (KABCO)	3.2	5.3	2.1

HSM1 Extended Spreadsheet for Part C Chapter 10 v.9.1

## Discussion of Results

Given the potential effects of project characteristics on safety performance, results indicate that:

- It is anticipated that the project will, on average, experience 5.3 crashes per year (2.3 fatal and injury crashes per year; and 3 property damage only crashes per year).
- A similar project is anticipated, on average, to experience 3.2 crashes per year (1.4 fatal and injury crashes per year; and 1.8 property damage only crashes per year).
- It is anticipated the project has, on average, a potential for safety improvement of 2.1 crashes per year (0.9 fatal and injury crashes per year; and 1.2 property damage only crashes per year).

PROJECT ELEMENT RESULTS SUMMARY <sup>1</sup>									
Summary for the project element	Total Crashes/yr (KABCO)			Fatal and Injury Crashes/yr (KABC)			Property Damage Only Crashes/yr (PDO)		
	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement
	N <sub>predicted</sub> (KABCO)	N <sub>expected</sub> (KABCO)		N <sub>predicted</sub> (KABC)	N <sub>expected</sub> (KABC)		N <sub>predicted</sub> (O)	N <sub>expected</sub> (O)	
	0.2	0.5	0.3	0.1	0.2	0.1	0.1	0.3	0.2

Special Note: When the project element is not included in the analysis the results will all be zeros. In addition if only the analysis only includes determining the predicted average crash frequency (i.e. EB analysis is not carried out), the results will show zero values where EB results are usually displayed.

<sup>1</sup> The values in this table are rounded values. For unrounded values, refer to Worksheet 1L.

# PROJECT SAFETY PERFORMANCE SUMMARY REPORT

## General Information

Project Name: Horse Heaven Wind Farm  
 Project Description: Safety Analysis (Full Mitigation)  
 Reference Number: 143-67639-23007  
 Analyst: Linde Thatcher  
 Agency/Company: WSDOT  
 Contact Email: linde.thatcher@tetrattech.com  
 Contact Phone: 508-786-2222  
 Date Completed: 07/21/23

Years of crash data incorporated into the analysis: 5

## PROJECT SUMMARY

### Summary of Anticipated Safety Performance of the Project (average crashes/year)

Project Element	Total Crashes/yr (KABCO)			Fatal and Injury Crashes/yr (KABC)			Property Damage Only Crashes/yr (PDO)		
	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement	Predicted average crash frequency	Expected average crash frequency	Potential for Improvement
	N <sub>predicted</sub> (KABCO)	N <sub>expected</sub> (KABCO)		N <sub>predicted</sub> (KABC)	N <sub>expected</sub> (KABC)		N <sub>predicted</sub> (O)	N <sub>expected</sub> (O)	
<b>INDIVIDUAL INTERSECTIONS</b>									
Intersection 1	0.5	1.2	0.7	0.2	0.5	0.3	0.3	0.7	0.4
Intersection 2	0.8	1.3	0.6	0.3	0.6	0.3	0.4	0.8	0.3
Intersection 3	1.0	1.5	0.6	0.4	0.7	0.2	0.5	0.9	0.3
Intersection 4	0.2	0.5	0.3	0.1	0.2	0.1	0.1	0.3	0.2
<b>COMBINED (sum of column)</b>	2.4	4.6	2.2	1.1	2.0	0.9	1.4	2.6	1.2

### PROJECT SUMMARY -- Site-Specific EB Method Summary Results for Rural 2-Lane Roads

Crash severity level	N <sub>predicted</sub> (PROJECT)	N <sub>expected</sub> (PROJECT)	N <sub>potential for improvement</sub> (PROJECT)
	Predicted average crash frequency - Average safety performance of projects consisting of similar elements (anticipated average crashes/yr)	Expected average crash frequency - Actual long-term safety performance of the project (anticipated average crashes/yr)	Potential for Safety Improvement (anticipated average crashes/yr)
Fatal and injury (KABC)	1.1	2.0	0.9
Property damage only (PDO)	1.4	2.6	1.2
Total (KABCO)	2.4	4.6	2.2

HSM1 Extended Spreadsheet for Part C Chapter 10 v.9.1

## Discussion of Results

Given the potential effects of project characteristics on safety performance, results indicate that:

- It is anticipated that the project will, on average, experience 4.6 crashes per year (2 fatal and injury crashes per year; and 2.6 property damage only crashes per year).
- A similar project is anticipated, on average, to experience 2.4 crashes per year (1.1 fatal and injury crashes per year; and 1.4 property damage only crashes per year).
- It is anticipated the project has, on average, a potential for safety improvement of 2.2 crashes per year (0.9 fatal and injury crashes per year; and 1.2 property damage only crashes per year).

## APPENDIX D: SIGHT DISTANCE CALCULATIONS

## Location: Route 221 at Sellards Road

### STOPPING SIGHT DISTANCE:

#### STOPPING SIGHT DISTANCE FROM **NORTH**

Inputs

V=	speed, mph	V=	72	(85th percentile speed)
G=	percent of grade	G=	-1.1	(%)
t=	brake reaction time	t=	2.5	
a=	deceleration rate, ft/sec <sup>2</sup>	a=	11.2	

Calculations

Brake Reaction Distance	$1.47Vt$	265 feet
Braking Distance	$\frac{V^2}{30[(a/32.2)+G]}$	513.0 feet
Stopping Sight Distance =	$1.47Vt + \frac{V^2}{30[(a/32.2)+G]}$	780 feet

#### STOPPING SIGHT DISTANCE FROM **SOUTH**

Inputs

V=	speed, mph	V=	71	(85th percentile speed)
G=	percent of grade	G=	1.25	(%)
t=	brake reaction time	t=	2.5	
a=	deceleration rate, ft/sec <sup>2</sup>	a=	11.2	

Calculations

Brake Reaction Distance	$1.47Vt$	261 feet
Braking Distance	$\frac{V^2}{30[(a/32.2)+G]}$	466.3 feet
Stopping Sight Distance =	$1.47Vt + \frac{V^2}{30[(a/32.2)+G]}$	730 feet

Source: *A Policy on Geometric Design of Highways and Streets*, 2018, Seventh Edition, prepared by AASHTO, p. 3-4 to 3-5.

## Location: Route 14 at Route 221

### STOPPING SIGHT DISTANCE:

#### STOPPING SIGHT DISTANCE FROM **EAST**

Inputs

V=	speed, mph	V=	65	(Posted Speed Limit)
G=	percent of grade	G=	-0.5	(%)
t=	brake reaction time	t=	2.5	
a=	deceleration rate, ft/sec <sup>2</sup>	a=	11.2	

Calculations

Brake Reaction Distance	$1.47Vt$	239 feet
Braking Distance	$\frac{V^2}{30[(a/32.2)+G]}$	410.8 feet
Stopping Sight Distance =	$1.47Vt + \frac{V^2}{30[(a/32.2)+G]}$	650 feet

#### STOPPING SIGHT DISTANCE FROM **WEST**

Inputs

V=	speed, mph	V=	65	(Posted Speed Limit)
G=	percent of grade	G=	0.9	(%)
t=	brake reaction time	t=	2.5	
a=	deceleration rate, ft/sec <sup>2</sup>	a=	11.2	

Calculations

Brake Reaction Distance	$1.47Vt$	239 feet
Braking Distance	$\frac{V^2}{30[(a/32.2)+G]}$	394.7 feet
Stopping Sight Distance =	$1.47Vt + \frac{V^2}{30[(a/32.2)+G]}$	635 feet

Source: *A Policy on Geometric Design of Highways and Streets*, 2018, Seventh Edition, prepared by AASHTO, p. 3-4 to 3-5.

## Location: Route 14 at S. Plymouth Road

### STOPPING SIGHT DISTANCE:

#### STOPPING SIGHT DISTANCE FROM **EAST**

Inputs

V=	speed, mph	V=	55	(Posted Speed Limit)
G=	percent of grade	G=	-0.3	(%)
t=	brake reaction time	t=	2.5	
a=	deceleration rate, ft/sec <sup>2</sup>	a=	11.2	

Calculations

Brake Reaction Distance	$1.47Vt$	202 feet
Braking Distance	$V^2/30[(a/32.2)+G]$	292.4 feet

Stopping Sight Distance =	$1.47Vt + V^2/30[(a/32.2)+G]$	495 feet
---------------------------	-------------------------------	----------

#### STOPPING SIGHT DISTANCE FROM **WEST**

Inputs

V=	speed, mph	V=	55	(Posted Speed Limit)
G=	percent of grade	G=	0.6	(%)
t=	brake reaction time	t=	2.5	
a=	deceleration rate, ft/sec <sup>2</sup>	a=	11.2	

Calculations

Brake Reaction Distance	$1.47Vt$	202 feet
Braking Distance	$V^2/30[(a/32.2)+G]$	285.0 feet

Stopping Sight Distance =	$1.47Vt + V^2/30[(a/32.2)+G]$	490 feet
---------------------------	-------------------------------	----------

Source: *A Policy on Geometric Design of Highways and Streets*, 2018, Seventh Edition, prepared by AASHTO, p. 3-4 to 3-5.

## Location: Webber Canyon Road at Badger Road

### STOPPING SIGHT DISTANCE:

#### STOPPING SIGHT DISTANCE FROM **NORTH**

Inputs

V=	speed, mph	V=	40	(Posted Speed Limit)
G=	percent of grade	G=	-0.5	(%)
t=	brake reaction time	t=	2.5	
a=	deceleration rate, ft/sec <sup>2</sup>	a=	11.2	

Calculations

Brake Reaction Distance	$1.47Vt$	147 feet
Braking Distance	$\frac{V^2}{30[(a/32.2)+G]}$	155.6 feet
Stopping Sight Distance =	$1.47Vt + \frac{V^2}{30[(a/32.2)+G]}$	305 feet

#### STOPPING SIGHT DISTANCE FROM **SOUTH**

Inputs

V=	speed, mph	V=	50	(Posted Speed Limit)
G=	percent of grade	G=	-0.3	(%)
t=	brake reaction time	t=	2.5	
a=	deceleration rate, ft/sec <sup>2</sup>	a=	11.2	

Calculations

Brake Reaction Distance	$1.47Vt$	184 feet
Braking Distance	$\frac{V^2}{30[(a/32.2)+G]}$	241.7 feet
Stopping Sight Distance =	$1.47Vt + \frac{V^2}{30[(a/32.2)+G]}$	430 feet

Source: *A Policy on Geometric Design of Highways and Streets*, 2018, Seventh Edition, prepared by AASHTO, p. 3-4 to 3-5.

## APPENDIX E: BACKGROUND TRAFFIC GROWTH RATE

## Background Traffic Growth Rate

Horse Heaven Wind Farm, Benton County Washington

	I-82 Average Annual Daily Traffic Volume <sup>1</sup>	
2018	20971	
2019	20939	
2020	18890	
2021	22093	<b>2018 to 2022 Percent Growth</b>
2022	22011	<b>1.0%</b>

*Note 1) AADT is provided by WSDOT using the Traffic Count Database System (TCDS) at Continuous Count Station P09 (North of Coffin Road)*

## APPENDIX F: PROJECT TRIP DISTANCE CALCULATIONS

Horse Heaven Wind & Solar Project  
Worker Population Gravity Model

# 2023 Existing - Morning Peak Hour Route 14 at S. Plymouth Road

Exhibit 1310-19 Right-Turn Lane Guidelines

Notes:

- [1] For two-lane highways, use the peak hour DDHV (through + right-turn).  
For multilane, highways (posted speed 45 mph or above), use the right-lane peak hour approach volume (through + right-turn).
- [2] When all three of the following conditions are met, reduce the right-turn DDHV by 20:
  - The posted speed is 45 mph or below
  - The right-turn volume is greater than 40 VPH
  - The peak hour approach volume (DDHV) is less than 300 VPH

- [3] For right-turn corner design, see Exhibit 1310-6.
- [4] For right-turn pocket or taper design, see Exhibit 1310-20.
- [5] For right-turn lane design, see Exhibit 1310-21.

## 2023 Existing - Evening Peak Hour Route 14 at S. Plymouth Road

**Exhibit 1310-19 Right-Turn Lane Guidelines**

Notes:

- [1] For two-lane highways, use the peak hour DDHV (through + right-turn).  
For multilane, highways (posted speed 45 mph or above), use the right-lane peak hour approach volume (through + right-turn).
- [2] When all three of the following conditions are met, reduce the right-turn DDHV by 20:
  - The posted speed is 45 mph or below
  - The right-turn volume is greater than 40 VPH
  - The peak hour approach volume (DDHV) is less than 300 VPH

- [3] For right-turn corner design, see Exhibit 1310-6.
- [4] For right-turn pocket or taper design, see Exhibit 1310-20.
- [5] For right-turn lane design, see Exhibit 1310-21.

## 2025 Phase 1 to Laydown Yard 2 - Morning Peak Hour Route 14 at S. Plymouth Road

**Exhibit 1310-19 Right-Turn Lane Guidelines**

Notes:

- [1] For two-lane highways, use the peak hour DDHV (through + right-turn).  
For multilane, highways (posted speed 45 mph or above), use the right-lane peak hour approach volume (through + right-turn).
- [2] When all three of the following conditions are met, reduce the right-turn DDHV by 20:
  - The posted speed is 45 mph or below
  - The right-turn volume is greater than 40 VPH
  - The peak hour approach volume (DDHV) is less than 300 VPH

- [3] For right-turn corner design, see Exhibit 1310-6.
- [4] For right-turn pocket or taper design, see Exhibit 1310-20.
- [5] For right-turn lane design, see Exhibit 1310-21.

## 2025 Phase 1 to Laydown Yard 2 - Evening Peak Hour

### Route 14 at S. Plymouth Road

Exhibit 1310-19 Right-Turn Lane Guidelines

#### Notes:

- [1] For two-lane highways, use the peak hour DDHV (through + right-turn).  
For multilane, highways (posted speed 45 mph or above), use the right-lane peak hour approach volume (through + right-turn).
- [2] When all three of the following conditions are met, reduce the right-turn DDHV by 20:
  - The posted speed is 45 mph or below
  - The right-turn volume is greater than 40 VPH
  - The peak hour approach volume (DDHV) is less than 300 VPH

- [3] For right-turn corner design, see Exhibit 1310-6.
- [4] For right-turn pocket or taper design, see Exhibit 1310-20.
- [5] For right-turn lane design, see Exhibit 1310-21.

## 2023 Existing - Morning Peak Hour

### Route 221 at Route 14

Exhibit 1310-19 Right-Turn Lane Guidelines

Notes:

- [1] For two-lane highways, use the peak hour DDHV (through + right-turn).  
For multilane, highways (posted speed 45 mph or above), use the right-lane peak hour approach volume (through + right-turn).
- [2] When all three of the following conditions are met, reduce the right-turn DDHV by 20:
  - The posted speed is 45 mph or below
  - The right-turn volume is greater than 40 VPH
  - The peak hour approach volume (DDHV) is less than 300 VPH

- [3] For right-turn corner design, see Exhibit 1310-6.
- [4] For right-turn pocket or taper design, see Exhibit 1310-20.
- [5] For right-turn lane design, see Exhibit 1310-21.

## 2023 Existing - Evening Peak Hour Route 221 at Route 14

**Exhibit 1310-19 Right-Turn Lane Guidelines**

Notes:

- [1] For two-lane highways, use the peak hour DDHV (through + right-turn).  
For multilane, highways (posted speed 45 mph or above), use the right-lane peak hour approach volume (through + right-turn).
- [2] When all three of the following conditions are met, reduce the right-turn DDHV by 20:
  - The posted speed is 45 mph or below
  - The right-turn volume is greater than 40 VPH
  - The peak hour approach volume (DDHV) is less than 300 VPH

- [3] For right-turn corner design, see Exhibit 1310-6.

## APPENDIX J: DETAILED DRAFT SAFETY PLAN

# Draft Traffic Safety Plan

Horse Heaven Wind & Solar September 2023

## Safety Plan

The draft Traffic Safety Plan (TSP) will assist in developing the Construction Transportation Management Plan (CTMP). The TSP will supply information about the future impacts to the transportation network due to the peak construction of the Horse Heaven Wind Farm Project (the Project). These impacts are expected to occur within and around the project boundary during the construction phases of the Project. This document will provide recommendations to enhance traffic safety during the construction of the Project.

## Objectives and Strategies

The objective of traffic safety management plan is:

- To avoid interrupting normal traffic flow. This flow varies depending on the time (rush hours, shift change) and location of the project entrances (cars, trucks, deliveries).
- For the management of traffic flow allowing project daily activities to be conducted in a safe manner.
- To protect all road users by defining the type of the required traffic safety equipment. The equipment to be used will be, but not limited to, truck route signage, detour route signage, barricades, traffic lights, safety cones, fences, closed road signs.
- To enclose and separate the walking/driving paths on site while construction work is being performed.

The Project has multiples strategy to ensure a smooth traffic flow in and out the project construction zone. These plans will be as follows:

- Ensuring construction tasks will be conducted sequentially to lessen any impacts as far as schedule or cost.
- Detailed safety project procedure will be issued with the involvement and approval of both project and safety management, taking into consideration the entrance to the project by both equipment and personnel.
- All entry and exit movements to and from traffic streams shall be in accordance with the projects core process and Environmental Safety and Health Plan (ES&H).
- Design the Project Driveways to include the proper number of traffic lanes and traffic control infrastructure to accommodate the traffic flow and provide safe exit onto the local roadway system.
- Maximize the deliveries to the site to be occur during off-peak construction worker commuting times

All traffic management works, and control devices shall be in accordance with Washington State and Federal Law for construction and improvement of roads. The safety manager and supervisors will work to implement the safety rules on site by keeping a close supervision on all personnel. They will take all reasonable measures to prevent accident or injury during the construction of the plant. All approved procedures and managements practices should be applied and closely implemented.

## Construction Traffic Management Plan

A Construction Traffic Management Plan (CTMP) will be developed in consultation with the Washington State Department of Transportation (WSDOT) and Benton County public works staff, as appropriate, prior to construction. The CTMP will follow WSDOT Design Manual 22-01.21 Chapter 1010. A CTMP is a key element in addressing known work zone safety and mobility impacts.

The TMP may include Temporary Traffic Control (TTC) Components such as:

- Lane closures or lane shifts
- Traffic Control devices

- Pavement markings
- Changeable message signs
- Temporary signals

Transportation Systems Management and Operations (TSMO) is the second component to a TMS. Key TSMO components may include Work Zone Safety Management strategies such as:

- Positive protective devices
- Speed limit reductions
- Automated flagger assistance devices
- Radar speed display signs

The final element of a TMP to be considered are Public Information and Awareness Strategies, which may include, but are not limited to, the following strategies:

- Public Awareness Strategies such as Brochures or mailers, press releases, paid advertisements, and project website (consider providing information in other languages if appropriate).
- Motorist Information Strategies such as Highway advisory radio (HAR), changeable message signs, and transportation management center (TMC).

## Impacts during Construction

During peak construction, a typical day would include the transportation of workers, transportation of materials, and movement of heavy equipment.

On-site workers would include technicians, laborers, foremen, equipment operators, and construction managers, with the majority of these positions expected to be filled by workers normally residing in Benton and Franklin Counties (Horse Heaven Wind Farm, LLC 2021). Most of the construction worker traffic would originate from the Tri-Cities of Kennewick, Pasco, and Richland, as well as nearby communities. The workforce would use the same roads to access the Project as the equipment transporters. To be conservative with analysis, it is assumed that workers would drive alone and that the average vehicle would only have 1.25 occupants (Horse Heaven Wind Farm, LLC 2021). Private vehicles would primarily travel mornings and evenings, corresponding to the workday, and the construction truck traffic would be more uniformly distributed throughout the workday. For the LOS analysis, the more conservative 374 worker trips for the construction of the first half of the Project and 344 worker trips for the construction of the second half of the Project were used. Three Project laydown yard locations have been preliminarily identified to facilitate the delivery and assembly of materials and equipment:

- One adjacent to the eastern substation location on Beck Road
- One along Locust Grove Road, East of S. Plymouth Road
- One along Locust Grove Road, between Nicoson Road and S. Clodfelter Road

During construction, trucks are anticipated to use I-82, State Route 397, State Route 221, and local Benton County roads to bring construction equipment, turbine components, solar components, substation equipment, and transmission line equipment to the various Project construction sites.

Trucks would also be used to bring road base aggregate to improve existing roads and construct new access roads; concrete for the turbine, substation, BESS, and O&M facility foundations; and water for dust control. Some large Project components such as turbine blades, tower components, and nacelles may be delivered to remote ports, such as the Port of Vancouver or Port of Longview, and transported overland via I-84 to I-82. Other components may originate within the continental United States and be transported overland from other locations to I-84 and on to I-82 (Horse Heaven Wind Farm, LLC 2021).

Equipment such as excavators, trenching equipment, backhoe loaders, cranes, forklifts, and other material handling equipment would be brought on site by a flatbed semi-tractor trailer and would remain on site throughout construction. Equipment such as water trucks, fuel trucks, service trucks, and trucks delivering components would make frequent trips to deliver supplies. Some trucks would be required to obtain oversize/overweight permits, which allow travel on all unrestricted roads.

## Applicant Commitments and Identified Mitigation (from DEIS 4.14.2.4)

This section describes the measures that would reduce or compensate for impacts related to traffic from construction, operation, and decommissioning of the Project. These measures would be implemented in addition to compliance with the environmental permits, plans, and authorizations required for the Proposed Action.

### Applicant Commitments

The Applicant has identified measures and/or best practices that are designed to prevent or minimize potential impacts on the affected environment for the Project. Measures presented by the Applicant in the ASC (Horse Heaven Wind Farm, LLC 2021), and taken into consideration in the characterization of potential impacts on traffic are discussed in Section 2.3 and summarized below.

- All road improvement and construction would be performed in conjunction with Benton County Public Works and WSDOT requirements. The Applicant would maintain new access roads to access the turbine structures during operations.
- Prior to commencement of construction, the Applicant would consult with WSDOT and Benton County on the development of a Construction Traffic Management Plan.
- The Applicant would obtain all necessary WSDOT permits to access, modify ingress and egress for, or transport regulated loads on state-managed roadways.
- The Applicant would obtain WSDOT trip permits for oversized and overweight loads.
- When slow or oversized wide loads are being hauled, appropriate vehicle and roadside signing and warning devices would be deployed. Pilot cars would be used as WSDOT dictates, depending on load size and weight.
- A detailed haul plan for the oversized wind material deliveries would be developed once turbines have been selected and the construction schedule developed. This haul plan would confirm source locations and routes to be used during Project construction, as well as anticipated loads and haul schedule.
- Ingress and egress points would be located and improved (if needed) to ensure adequate capacity for existing and projected traffic volumes and to provide efficient movement of traffic, including existing and anticipated agricultural traffic.
- The Applicant would coordinate with EFSEC and Benton County, to identify a qualified third-party engineer who would document road conditions prior to construction and again within 30 days after construction is complete or as weather permits.
- A service agreement between the Applicant and Benton County would ensure post-construction road restoration to conditions as good or better than preconstruction.
- The Applicant or its contractor and EFSEC staff would meet prior to final site plan approval to outline steps for minimizing construction traffic impacts, including conflicts if state-imposed roadway restrictions could affect transporter routes.
- The Applicant or its contractor would provide advance notification to adjacent landowners and farmers through mailing, informal meeting, open house, or other similar methods when construction would take place in the vicinity of their homes and farms to help minimize access disruptions.
- All construction vehicles would yield to school-related vehicles (e.g., school buses) and would lower their speed when approaching a school bus or bus stop along the transporter route.

- Temporary advanced warning and proper roadway signage would be placed on major state and Benton County roads to warn motorists of potential construction-related vehicles turning.
- Carpooling among the construction workers would be encouraged to reduce traffic volume to and from the Project site.
- Detour plans and warning signage would be provided in advance of any planned traffic disturbances.
- Flaggers would be employed as necessary to direct traffic when large equipment is exiting or entering public roads to minimize the risk of accidents. Should the Applicant or its construction contractor receive notice during Project construction of transportation events (e.g., WSDOT or Benton County transportation projects, roadway incidents, other traffic events) that give rise to a safety concern, the Project construction manager would review the CTMP in coordination with the applicable agency and address additional safety measures, including flagging, as may be appropriate for the situation.
- If a lane closure must occur, adequate signage for potential detours or possible delays would be posted.
- Advance notification would be provided to emergency providers and hospitals when public roads may be partially or completely closed.
- Emergency vehicles would be given the right-of-way as required by local, state, and federal requirements.
- Site access roads and an entrance driveway to the O&M facilities on site would be constructed to service truck movements of legal weight and provide adequate sight distance.
- Traffic control requests would be coordinated through the WSDOT traffic engineer and the Benton County Public Works Department abiding by seasonal County Road restrictions.
- A haul and approach route would be developed in coordination with the appropriate jurisdictional authorities.
- Permanent private Project access roads would be maintained by the Applicant for the life of the Project.
- Tracked vehicles and heavy trucks would be restricted to approved transporter roads to prevent damage to the surface and base of Benton County roads.
- After construction, all-weather access roads (including graveled roads), suitable to handle emergency equipment, would be provided to within 150 feet of any built structure or surface activity area.

## Safety Procedures

### Personal Protective Equipment

All employees are required to wear Personal Protective Equipment (PPE) including subcontractors in charge of road modification and traffic control. PPE includes highlighted vest, protective footwear, eye protections, helmet, sun protection, respiratory devices and ear plugs if needed (etc) on the worksite.

### Facility Equipment

All plant equipment shall meet statutory requirements and have the required registration, licenses or certifications where needed. All mobile equipment shall be fitted with suitable reversing alarms. All mobile plant and vehicles shall be fitted with a pair of flashing yellow lamps.

### Incident/Accident Procedures

In the event of an accident or incident, whether involving traffic or road users, all work shall be ended, and traffic shall be stopped and rerouted as necessary to avoid further incidents. Safety, health, and environmental personnel, (ESH) should be immediately informed.

Broken down vehicles and vehicles involving in minor non-injury crashes shall be temporarily moved to the shoulder as soon as possible after details of the crash locations have been gathered and noted to maintain traffic flow. Details of all incidents and accidents shall be reported to the Site safety supervisor and Project Manager using the incident report form. Traffic incidents occurring due to the works that occur on public roads will be communicated to local authorities.

## Responsibilities

### Project Management

Project Management has the ultimate responsibility to ensure that the presented plan is implemented per approved procedures and the designated personnel will be monitoring the execution of the work to prevent any kind of injury or property damage to employees, contractors, sub-contractors, road users and all members of the public.

### Safety management and supervision

The safety management and supervision team will ensure all site personnel are fully aware of the job location and that traffic controllers are correctly trained. Personnel protective equipment (PPE) will be enforced and always worn during the work period.

### Construction management

Construction management should ensure that the traffic plan is being followed by everyone and contractor will supply sufficient controllers to continuously supervise the road improvement work and traffic flow to avoid delay and traffic congestion.

Construction management will be responsible for coordination-with safety personnel to ensure compliance with the CTMP and applicable procedures before, during and after the work completion. It is important to remind the subcontractor and its personnel to follow the safety rules and execution process to avoid any incidents or delay. Construction management will report to the project manager on progress and will support engineering on the design.

### Construction personal

Construction personal should be trained and execute the work per the project procedures and the project schedule.

### Contractor

Contractor will ensure that all signs, barricades, and equipment to control the traffic are properly installed and functional before, during and after work hours.

### Contractor Project Manager

Contractor project manager shall:

- Ensure all traffic control measures of this TMP are placed and maintained in accordance with this plan and the relevant Acts, Codes, Standards and Guidelines
- Ensure suitable communication and consultation with the owner is maintained at all times
- Ensure inspections of the Traffic Controls are undertaken in accordance with the TMP, and results recorded.
- Review feedback from construction and safety and take action to amend the traffic control measures as approved by the state authority representative.

### Site Supervisors

Site supervisors on the jobsite will ensure that all proper documents are correctly filled out and daily safety meetings are conducted prior to start of work. Moreover, they will follow the correct work practices as required by WSDOT outside the project boundaries and project procedures inside the project area.

Site supervisors will be responsible for overseeing the day-to-day activities performed by subcontractor. Ensure traffic control measures are implemented and maintained by the subcontractor. Moreover, undertake and submit the required inspection and evaluation reports to construction representative to take appropriate action to correct unsafe conditions.

## WSDOT

WSDOT representatives will support and advise on the progress of the work with site safety and supervisory personnel on work located outside the construction site limits. WSDOT may direct erection, relocation or removal of signs or devices, which, in the opinion of the WSDOT Representative, are not in accordance with the TMP and do not supply sufficient safety for road users.

## Worksite Access

### Pedestrian Access

There is no specific facility or service nearby that would include pedestrian on the roads neither increase normal use of the road facilities by people with disabilities and other vulnerable road users. Moreover, there are no schools in the vicinity of the worksite, and no significant numbers of children are expected.

### Cyclists and Bikers

No cyclist will be present on work site. However, we can expect cyclists along local roadways throughout the study area.

### Site Access for Works Vehicles

Construction vehicles entering and exiting the traffic stream shall be mindful of the conditions that may affect the safety of these movements. Vehicles shall reduce the speed and signal their intention by indicator to leave / enter the traffic stream. If the vehicle is disabled, driver should switch on the hazard lights.

### Emergency Vehicle Access

At all times when employees are on job location, the Site Supervisor will take whatever action is practicable to assist emergency vehicles, tow trucks and/or service vehicles to gain access to crash or vehicle breakdown sites which are causing or have the potential to cause an obstruction to traffic flow or imperil the safety of road users.

### Public Transport

There is no public transport that will be affected by the works.

### Access to Adjoining Development/Properties

No properties will be impacted by the proposed work.

### School Crossings

There are no school crossings on the worksite. No impacts expected.

### Heavy and Oversize Vehicles and Loads

Any heavy or oversized vehicle used during construction activities will comply with the Washington state law and applicable WSDOT requirements.

### Railroad Crossings

Railroad crossings within the vicinity of the project and along the assumed transportation routes for materials were analyzed and listed below.

- Crossing 927487A, where train tracks cross over Webber Canyon Road
- Crossing 928191E, where train tracks cross under I-82 near West Clearwater Avenue
- Crossing 928192L, where train tracks cross Dallas Road at grade
- Crossing 966466M, where train tracks cross under eastbound I-82 near the Lewis and Clark Trail Highway
- Crossing 966467U, where train tracks cross under westbound I-82 near the Lewis and Clark Trail Highway

All crossings except Crossing 928192L are located above (overpass) or under (underpass) the transport route. Crossing 928192L, where train tracks cross Dallas Road is a grade crossing, meaning that the crossing occurs at the same grade as other traffic. No Truck haul routes and limited worker journey to work routes are expected to use Dallas Road.

## Contingency Planning

### Road Crash or Vehicle Breakdown within Site

In the event of road crash within the work area that may impact services requiring access to a crash site that area will be cleared to allow access. On-site traffic controllers/ ES&H will be equipped with mobile communications to advise and/or liaise with emergency services to ensure a prompt response is provided.

There will be accredited First Aid personnel on site to assist where required.

### Serious Injury or Fatality

In the case of serious injury or fatality occurring within the traffic control zone, all work shall cease immediately, machinery and vehicles turned off and the area cleared of personnel as soon as possible. Traffic Controllers (and other personnel if necessary) shall be deployed immediately to ensure no traffic or other road users approach the area.

Emergency services shall be notified of the incident and all road workers and traffic management personnel shall preserve the scene leaving everything in situ, until direction is given by ES&H and law reinforcement.

All site personnel shall be briefed on control procedures covering incidents and crashes that result in serious injury or fatalities.

### Emergency Contacts

In the event of an emergency the following relevant authorities must be contacted and advised of nature of works, location, type of emergency and contact details for the site supervisor.

Emergency Service	E-mail/Website	Phone (Emergency)
Kennewick Police Department	<a href="https://www.go2kennewick.com/386/Police">https://www.go2kennewick.com/386/Police</a>	911
Richland Police Department	<a href="https://www.ci.richland.wa.us/departments/police-services">https://www.ci.richland.wa.us/departments/police-services</a>	911
Benton County Emergency Services	<a href="https://www.bces.wa.gov/">https://www.bces.wa.gov/</a>	(509) 628-2600
Benton County Fire District 1	<a href="https://www.bentonone.org/">https://www.bentonone.org/</a>	911 or (509) 737-0911

### Recommended Mitigation Measures

EFSEC has identified the following additional and modified mitigation measures that could be required by EFSEC, but may also involve the participation of other parties, for the Project to avoid and/or minimize potential impacts on transportation. EFSEC would work with the identified parties to facilitate cooperation in implementing this mitigation measure:

**TR-1<sup>1</sup>:** To ensure safe practices during the transportation of materials during construction and decommissioning, the load movement team would review the procedures to be followed if the load should become lodged at a crossing and would review the emergency contact numbers for each crossing daily—that is, before starting travel for the day.

---

<sup>1</sup> Identifier of numbered mitigation item for Transportation

**TR-2:** To mitigate potential collisions at train crossings, the Applicant would work with WSDOT and Operation Lifesaver to provide train safety presentations to employees and contractors to increase knowledge regarding train safety, including train track crossings.

**TR-3:** To ensure that no changes have occurred since the traffic analysis originally provided prior to construction, a third-party engineer would provide a traffic analysis prior to decommissioning. The traffic analysis would evaluate all modes of transportation (e.g., waterways, rail, roads, etc.) used for the movement of people and materials during decommissioning via the haul route(s) in Washington State.

**TR-4:** To ensure that no changes have occurred since the route survey originally provided prior to construction, all railroad crossings and grade changes would be included in a route survey performed by a third-party engineer with the Washington Utilities and Transportation Commission participating to determine if current traffic control systems at crossings are appropriate or if additional mitigation is needed prior to decommissioning. The route survey would include anticipated traffic counts. Since this measure would require the participation of other agencies to be implemented, it cannot be considered fully effective mitigation for the purpose of this analysis.

**TR-5:** The analysis of impacts from decommissioning is based on existing laws and regulations at the time when the ASC was submitted to EFSEC. To ensure that no changes have occurred to laws and regulations used in this analysis, the Applicant would consult with WSDOT and Benton County on the development of a decommissioning-stage Traffic and Safety Management Plan, prior to decommissioning. The Traffic and Safety Management Plan must include a safety analysis of the WSDOT-controlled intersections (in conformance with the WSDOT Safety Analysis Guide) and recommend mitigation or countermeasures where appropriate. The analysis would review impacts from decommissioning traffic and be submitted to WSDOT for review and comment prior to decommissioning activities.
